WEBVTT

1
00:00:06.100 --> 00:00:07.480
Every technological era

2
00:00:08.420 --> 00:00:09.360
starts with a moment.

3
00:00:10.500 --> 00:00:13.240
The moment the impossible becomes inevitable.

4
00:00:16.360 --> 00:00:19.960
For 40 years, we've built the foundation behind those moments.

5
00:00:22.090 --> 00:00:25.820
And as AI transforms every industry, we're building the

6
00:00:25.840 --> 00:00:27.200
infrastructure it runs on.

7
00:00:28.140 --> 00:00:28.670
A system

8
00:00:30.620 --> 00:00:31.520
that runs itself.

9
00:00:33.740 --> 00:00:36.020
Agents working together across every domain,

10
00:00:38.180 --> 00:00:42.120
finding and resolving problems before they become

11
00:00:42.160 --> 00:00:42.560
yours.

12
00:00:46.760 --> 00:00:48.700
Replacing reactive manual work

13
00:00:51.640 --> 00:00:54.000
with unified autonomous infrastructure.

14
00:01:00.660 --> 00:01:02.180
Because when all the noise stops,

15
00:01:04.720 --> 00:01:06.420
the real work can begin.

16
00:01:12.970 --> 00:01:15.020
Please welcome DJ Sampath.

17
00:01:21.200 --> 00:01:25.140
Hello, and welcome everybody. I know just

18
00:01:25.200 --> 00:01:28.120
as I was coming up, this thing fell off, so I'm going to pop this into my back

19
00:01:28.160 --> 00:01:31.460
pocket. But I hope you all enjoyed the keynote. How was the keynote?

20
00:01:32.980 --> 00:01:33.500
All right.

21
00:01:35.620 --> 00:01:39.440
Fantastic. Folks, I'm so glad you all made it in

22
00:01:39.500 --> 00:01:43.480
time for this one. I know it was a little bit of a hustle, but I'm

23
00:01:43.700 --> 00:01:47.500
so excited about the kind of innovation that the team has been

24
00:01:47.540 --> 00:01:50.180
cooking up. And today, I'm going to take you through

25
00:01:51.960 --> 00:01:55.420
some more demos which are going to go beyond what you just saw up on stage.

26
00:01:55.440 --> 00:01:57.120
We're going to do a double click into this.

27
00:01:57.500 --> 00:01:59.240
That's what the deep dives are meant for, right?

28
00:02:00.100 --> 00:02:03.440
And you're going to see a few of my colleagues come up on stage, and then we'll

29
00:02:03.760 --> 00:02:06.320
start to get into it. But before I do that, I want to set the frame.

30
00:02:06.800 --> 00:02:10.480
I want to just double-click a little bit into what Jeetu was talking about earlier

31
00:02:10.861 --> 00:02:11.520
at the keynote.

32
00:02:13.280 --> 00:02:16.600
One of the key things that we're trying to accomplish here

33
00:02:17.320 --> 00:02:17.820
is to

34
00:02:18.660 --> 00:02:21.780
fundamentally change the way you operate your infrastructure.

35
00:02:22.600 --> 00:02:22.720
Right?

36
00:02:23.820 --> 00:02:24.880
Imagine waking up

37
00:02:26.380 --> 00:02:30.260
every single day to that welcome that you just saw right there

38
00:02:30.280 --> 00:02:32.820
where it says, "Hey, DJ, here are your actions.

39
00:02:33.480 --> 00:02:35.760
I've already taken care of a whole bunch of things for you."

40
00:02:37.160 --> 00:02:40.530
Knowing that the agents are working seamlessly behind the scenes makes all the

41
00:02:40.560 --> 00:02:40.900
difference.

42
00:02:43.220 --> 00:02:46.440
And so here, we're going to focus on these three things

43
00:02:47.120 --> 00:02:50.940
as our top priority. The first one is simplicity without losing

44
00:02:51.040 --> 00:02:51.760
sophistication.

45
00:02:53.040 --> 00:02:56.850
Cisco has built amazing dashboards, amazing management plans in

46
00:02:56.920 --> 00:02:59.980
each one of these specific domains.

47
00:03:00.400 --> 00:03:03.010
What we're doing now is to say, "Hey, listen, we're going to start to bring all of

48
00:03:03.040 --> 00:03:06.900
these pieces together, but we're going to do this in a way that we

49
00:03:06.920 --> 00:03:09.980
don't lose the sophistication that you had available to you."

50
00:03:11.380 --> 00:03:14.070
Second, we're going to start operating at agent speed.

51
00:03:14.620 --> 00:03:18.020
We're defining a brand-new phrase, agent speed,

52
00:03:18.760 --> 00:03:20.200
because agents move really fast.

53
00:03:21.720 --> 00:03:25.359
And we want to define the core principles of what we mean by agent speed.

54
00:03:26.540 --> 00:03:29.160
And then finally, we want to leverage an open ecosystem.

55
00:03:29.460 --> 00:03:33.060
You saw and you heard about the cool things that we're doing with the ecosystem,

56
00:03:33.100 --> 00:03:35.800
and I want to talk to you a little bit about that, and hopefully, I can show you

57
00:03:35.960 --> 00:03:36.580
some of that as well.

58
00:03:37.820 --> 00:03:40.840
Now, when we talk about simplicity without losing sophistication,

59
00:03:42.700 --> 00:03:46.540
all the Cisco products that you know and love are now going to be managed

60
00:03:46.720 --> 00:03:48.180
within Cisco Cloud Control.

61
00:03:49.660 --> 00:03:52.660
Because Cloud Control is a single operational plane.

62
00:03:54.200 --> 00:03:57.840
One login to be able to sign in, one shared and unified view,

63
00:03:58.280 --> 00:04:01.480
and we're going to bring all of these pieces, and we're going to subsume Meraki,

64
00:04:01.680 --> 00:04:04.200
Catalyst, Security Cloud Control, Intersight, Splunk,

65
00:04:05.780 --> 00:04:06.430
Collaboration,

66
00:04:07.360 --> 00:04:11.340
Control Hub, and you're also going to see the fact that we seamlessly

67
00:04:11.380 --> 00:04:12.900
connect this into Cisco IQ.

68
00:04:14.820 --> 00:04:18.740
So it's far simpler, but you don't lose any of the controls that

69
00:04:18.760 --> 00:04:20.649
you would normally get from any one of those dashboards.

70
00:04:20.800 --> 00:04:23.960
The full functionalities of those dashboards are going to be available to you

71
00:04:24.000 --> 00:04:25.820
inside of Cisco Cloud Control.

72
00:04:27.720 --> 00:04:30.140
Now, when we talk about operating at agent speed,

73
00:04:31.360 --> 00:04:34.300
we need three core things to happen for you to be able to do that.

74
00:04:34.520 --> 00:04:38.460
The first one is we need to bring you cross-domain telemetry together

75
00:04:38.480 --> 00:04:41.800
into a single place so that humans and agents can

76
00:04:41.840 --> 00:04:43.380
troubleshoot and debug together.

77
00:04:45.720 --> 00:04:48.500
The second thing that you're going to need to be able to make this happen, right,

78
00:04:48.800 --> 00:04:50.960
is you're going to need purpose-built models.

79
00:04:52.500 --> 00:04:56.320
Our AI research teams have been hard at work trying to build a model that

80
00:04:56.340 --> 00:04:58.800
understands network configuration and network topology.

81
00:04:59.020 --> 00:05:00.220
That's the deep network model.

82
00:05:01.820 --> 00:05:04.300
It's been trained on over 40-plus years of how

83
00:05:05.120 --> 00:05:08.110
Cisco has learned to be able to debug and troubleshoot these networks.

84
00:05:10.020 --> 00:05:13.860
We also have a Foundation SEC model, which is a security model that is open source

85
00:05:13.880 --> 00:05:16.180
and available for you to be able to use to

86
00:05:17.380 --> 00:05:19.540
triage alerts, to summarize threats.

87
00:05:19.640 --> 00:05:22.400
It understands IOCs, indicators of compromise.

88
00:05:22.440 --> 00:05:25.340
It understands CVEs, common vulnerabilities exposures.

89
00:05:25.690 --> 00:05:29.580
I could throw up a whole lot more of acronyms over here, but

90
00:05:29.600 --> 00:05:30.960
guess what? That model understands it.

91
00:05:31.020 --> 00:05:34.020
That model understands exactly what all of those things mean.

92
00:05:34.060 --> 00:05:37.020
It speaks that language, and that's what we do with these purpose-built models.

93
00:05:37.480 --> 00:05:38.740
These models understand that language.

94
00:05:40.280 --> 00:05:44.130
Finally, you've got trusted agents that do the heavy lifting

95
00:05:44.420 --> 00:05:48.050
while humans stay in control. And they use these cross-domain telemetry and these

96
00:05:48.060 --> 00:05:49.600
purposeful models to be able to do what they do.

97
00:05:51.320 --> 00:05:51.460
Now,

98
00:05:54.020 --> 00:05:56.780
when we talked about the ecosystem, we really meant it.

99
00:05:57.680 --> 00:06:01.620
Folks, we have over 50 partners that are

100
00:06:01.700 --> 00:06:04.390
seamlessly connecting into Cisco Cloud Control.

101
00:06:05.980 --> 00:06:08.860
This is nothing short of being incredible, and we're just getting started.

102
00:06:09.320 --> 00:06:13.280
This is why we're building an open ecosystem, because we know that you need

103
00:06:13.360 --> 00:06:17.320
your agents to seamlessly work with agents from each and every single one

104
00:06:17.360 --> 00:06:20.800

of these partners to be able to solve meaningful outcomes for you.

105
00:06:22.740 --> 00:06:26.420
Now, to give you an even better, deeper dive

106
00:06:26.640 --> 00:06:29.120
into the product that you just saw me demo in the keynote,

107
00:06:30.160 --> 00:06:32.860
I'm going to invite some of my team to show you more.

108
00:06:33.100 --> 00:06:37.060
So Esha, please come on up and tell us the magic of

109
00:06:37.120 --> 00:06:39.080
Cloud Control. Put your hands together for Esha.

110
00:06:42.420 --> 00:06:42.960
Hi, DJ.

111
00:06:43.450 --> 00:06:43.450
Hey.

112
00:06:43.460 --> 00:06:45.420
Nice to see you. Great keynote, by the way.

113
00:06:45.620 --> 00:06:46.320
Nice to see you as well. Oh, thank you.

114
00:06:46.520 --> 00:06:50.300
I'm so excited for everyone in this room to get their hands on Cisco Cloud Control,

115
00:06:50.460 --> 00:06:53.880
because as you mentioned before, everyone in this room is used to

116
00:06:53.960 --> 00:06:56.860
operating in their own console, their own context.

117
00:06:57.880 --> 00:07:01.460
Each best in class, don't get me wrong, but Cisco Cloud Control is

118
00:07:01.580 --> 00:07:05.400
truly what unifies the entire Cisco portfolio under one

119
00:07:05.440 --> 00:07:05.840
umbrella.

120
00:07:06.040 --> 00:07:06.400
That's right.

121
00:07:06.460 --> 00:07:10.400
So as you can see, I've logged in here with a single set of credentials, and

122
00:07:10.460 --> 00:07:13.720
it takes me to this simple AI-first homepage.

123
00:07:14.240 --> 00:07:18.060
No menu to navigate, no dashboards to dig into as soon as you

124
00:07:18.120 --> 00:07:22.060
jump in. Just a simple AI native experience where you can come and ask any

125
00:07:22.120 --> 00:07:23.620
questions about your Cisco portfolio.

126
00:07:23.800 --> 00:07:27.480
That sounds awesome. Esha, I've got your screen mirrored over here for me, so I'm

127
00:07:27.500 --> 00:07:29.680
going to take a look at it over here while you go through this, all right?

128
00:07:30.060 --> 00:07:30.440
Perfect.

129
00:07:31.260 --> 00:07:33.380
And then if you can see, we have these three modes up here.

130

00:07:33.560 --> 00:07:37.480
This is the assistant for any quick tasks, quick questions that you would

131
00:07:37.520 --> 00:07:41.100
like to ask. The canvas, on the other hand, is for deeper

132
00:07:41.120 --> 00:07:44.340
investigation, deep reasoning, troubleshooting,

133
00:07:44.860 --> 00:07:46.200
and collaborating with your team.

134
00:07:46.320 --> 00:07:50.120
Think about it as a workspace where your team is collaborating with each other

135
00:07:50.280 --> 00:07:52.100
as well as agents. Isn't that great?

136
00:07:53.040 --> 00:07:57.020
What are these things on top, Esha? These boxes that I see right on top.

137
00:07:57.400 --> 00:08:00.080
Yeah. So you have a quick start, like a prompt library.

138
00:08:00.400 --> 00:08:04.020
So if you don't know what to ask it, you can just go click into any one of these,

139
00:08:04.120 --> 00:08:08.070
and it will easily spit out an explanation of what's going on in

140
00:08:08.080 --> 00:08:08.880
your infrastructure.

141
00:08:08.920 --> 00:08:12.500
That's right, folks. Imagine if you go to ChatGPT today, you see the sample prompts

142
00:08:12.520 --> 00:08:14.540
at the bottom that help you get started.

143
00:08:14.560 --> 00:08:18.440
We made these sample templates for you so that you could just click into this to be

144
00:08:18.500 --> 00:08:20.740
able to check the health and availability of networks.

145
00:08:20.780 --> 00:08:23.960
You could do WLAN performance. You can check into your data center computer

146
00:08:24.020 --> 00:08:26.400
operations. Those are really cool. You should check them out.

147
00:08:26.800 --> 00:08:30.580
Absolutely. And the next thing you can see here is actions. You see this red dot?

148
00:08:30.680 --> 00:08:33.441
This means that there's a bunch of things you need to go review.

149
00:08:33.821 --> 00:08:37.300
Now, what's amazing about this is it's actually signals that are being

150
00:08:37.380 --> 00:08:40.900
correlated from your entire Cisco estate and telling you

151
00:08:40.941 --> 00:08:44.030
exactly what to do, and it's paired with recommended next steps.

152
00:08:44.569 --> 00:08:48.009
But hold on. The agents are doing the investigating and

153
00:08:48.080 --> 00:08:51.980
monitoring for you, but when it comes to actually executing on this

154
00:08:52.020 --> 00:08:54.810
decision, it's put in front of the operator to approve.

155
00:08:54.940 --> 00:08:56.460
And Esha, that's really important, right?

156
00:08:56.880 --> 00:09:00.700
Because a lot of times I get this question from folks that says, "Hey, if agents

157
00:09:00.740 --> 00:09:03.770
are going to do everything, I really worry about this because my infrastructure is

158
00:09:03.800 --> 00:09:05.620
too critical, and I want to be really careful.

159
00:09:06.000 --> 00:09:07.040
So I want to be in the loop."

160
00:09:07.220 --> 00:09:07.320
That's right.

161
00:09:07.360 --> 00:09:09.400
So you're saying that we always make sure that humans are in the loop.

162
00:09:09.520 --> 00:09:10.160
Absolutely.

163
00:09:11.600 --> 00:09:13.480
Now let me take you to this nine dot.

164
00:09:13.880 --> 00:09:17.300
And as you can see here, we've actually consolidated all of Cisco's

165
00:09:17.340 --> 00:09:21.300
portfolio under this platform and across data center,

166
00:09:21.500 --> 00:09:25.280
campus and branch, cloud. Everything is under one roof.

167
00:09:25.400 --> 00:09:28.640
Meraki, Intersight, Nexus Hyperfabric, security, Splunk,

168
00:09:28.680 --> 00:09:31.920
collaboration, ThousandEyes, IQ, Nexus Dashboard,

169
00:09:32.480 --> 00:09:35.580
everything right here. But it's not just a set of links.

170
00:09:35.920 --> 00:09:39.560
You can actually manage all of these dashboards from within Cisco Cloud

171
00:09:39.620 --> 00:09:41.860
Control. Let me show you one of those.

172
00:09:44.660 --> 00:09:47.330
This is really cool. Now, when you clicked into that,

173
00:09:48.160 --> 00:09:52.150
what's going to happen next is you're not going to have to log in again,

174
00:09:52.360 --> 00:09:54.930
right? It's a single login that just gets you over there and-

175
00:09:54.930 --> 00:09:58.920
That's absolutely correct, DJ. Cisco Cloud Control works

176
00:09:58.960 --> 00:10:02.789
on something called Cisco Unified Identity, which is a common identity layer,

177
00:10:03.360 --> 00:10:07.140
and it follows you as you traverse through the platform so that your team can

178
00:10:07.220 --> 00:10:11.080
have seamless access and never leave the context of Cloud Control.

179
00:10:11.140 --> 00:10:11.620
That's awesome.

180
00:10:11.630 --> 00:10:15.540
And so if you wanted to make a firewall rule change or a zero-trust policy update

181
00:10:15.580 --> 00:10:19.440

from secure access, everything can be done business as usual from right

182
00:10:19.480 --> 00:10:20.080
within here.

183
00:10:21.200 --> 00:10:23.199
And then let me give you another example. Intersight.

184
00:10:23.360 --> 00:10:26.610
If you wanted to manage your data center, you can come to Intersight right from

185
00:10:26.660 --> 00:10:30.450
this dashboard, all your servers, UCS blades,

186
00:10:30.580 --> 00:10:34.390
firmware updates, capacity management, everything from this

187
00:10:34.440 --> 00:10:34.960
single pane.

188
00:10:35.110 --> 00:10:36.450
Hey, Esha, pause there for a second.

189
00:10:36.520 --> 00:10:39.590
Folks, you're seeing here something that I did not show in the keynote,

190
00:10:39.760 --> 00:10:43.500
right? What Esha did was just she clicked into those buttons on the

191
00:10:43.540 --> 00:10:47.380
top, which said Security or Meraki or Intersight, and you saw that the

192
00:10:47.420 --> 00:10:50.680
whole thing loaded straight up inside of Cloud Control.

193
00:10:51.720 --> 00:10:55.630
That same dashboard that you know and that you love is now

194
00:10:55.640 --> 00:10:59.420

being rendered seamlessly inside of Cloud Control, and you didn't have to log

195
00:10:59.460 --> 00:11:02.120
in, you didn't have to go to multiple dashboards, you didn't have to pivot.

196
00:11:02.140 --> 00:11:06.120
It's all in one place. That's super cool.

197
00:11:06.160 --> 00:11:09.970
Let me tell you one more thing, DJ. What happens when we bring all of these

198
00:11:09.980 --> 00:11:13.730
products under one roof, it allows us to create these incredible

199
00:11:13.740 --> 00:11:17.360
platform services. And let me tell you, the data's not just

200
00:11:17.480 --> 00:11:21.250
aggregated. It's normalized, correlated, so that you can get

201
00:11:21.280 --> 00:11:25.140
these rich, powerful insights across your estate, which

202
00:11:25.160 --> 00:11:28.600
would take somebody normally hours to put together reports on.

203
00:11:29.000 --> 00:11:30.840
So would you like me to walk you through an example of that?

204
00:11:30.860 --> 00:11:31.920
Yeah. Show me one of those.

205
00:11:31.980 --> 00:11:33.620
All right. Let's dive into inventory.

206
00:11:34.200 --> 00:11:38.170
So like you can see here, this is the inventory snapshot across your entire Cisco

207
00:11:38.260 --> 00:11:40.620
estate, but it's not just a simple list.

208
00:11:40.960 --> 00:11:44.280
We have actionable insights at the top. You can see your PSIRTs.

209
00:11:44.410 --> 00:11:48.160
You can see the security exposure, life cycle horizon, compliance

210
00:11:48.260 --> 00:11:52.200
posture, and even a quick snapshot of the distribution of your

211
00:11:52.280 --> 00:11:54.620
assets across the product families that you own.

212
00:11:54.940 --> 00:11:57.220
Esha, this is really important. I want to take a minute here.

213
00:11:57.320 --> 00:12:01.300
Folks, if you think about this right now in a post-MITOS era, a lot of

214
00:12:01.340 --> 00:12:05.270
you all have to care deeply about exactly what vulnerabilities

215
00:12:05.320 --> 00:12:07.360
exist inside of your infrastructure.

216
00:12:07.860 --> 00:12:11.640
And it becomes important even more so for you to be able to get a good

217
00:12:11.700 --> 00:12:12.960
understanding of your inventory.

218
00:12:13.360 --> 00:12:16.820
Doesn't matter what you have, you have to have a complete understanding
of

219
00:12:17.240 --> 00:12:20.880
every single one of your switch, your routers, your access points, your
devices,

220
00:12:20.920 --> 00:12:21.420
your collab

221
00:12:22.380 --> 00:12:24.060
devices, all of them in a single place.

222
00:12:25.000 --> 00:12:26.020
That's really, really cool.

223
00:12:26.100 --> 00:12:29.860
That is really impressive. And we also have a list view, but what's cool

224
00:12:29.920 --> 00:12:33.580
about this list view is I can use the simple natural language

225
00:12:33.600 --> 00:12:34.270
capability

226
00:12:35.400 --> 00:12:39.270
to search for anything. So show devices that are not compliant,

227
00:12:39.520 --> 00:12:43.140
and here it is. Natural language, it took me 10 seconds, and it popped

228
00:12:43.220 --> 00:12:45.330
up all of my devices that are not compliant.

229
00:12:45.640 --> 00:12:49.540
If I wanted to go a click deeper right here on the right-hand side panel

230
00:12:49.580 --> 00:12:52.980
is the metadata related to that asset, so I can go even

231
00:12:53.420 --> 00:12:57.149
deeper into this experience. What's nice about this is I didn't have to
sit and

232
00:12:57.200 --> 00:13:01.160
write long queries or look for filters to apply.

233

00:13:01.200 --> 00:13:03.080
Natural language is the new way.

234
00:13:03.200 --> 00:13:04.270
How many of you here

235
00:13:05.480 --> 00:13:06.940
think that this is cool? Quick show of hands.

236
00:13:08.060 --> 00:13:08.130
Whoo.

237
00:13:08.130 --> 00:13:11.120
What? All right. That's everybody. That's amazing. All right.

238
00:13:11.540 --> 00:13:14.820
So you don't have to now put on complex queries.

239
00:13:14.880 --> 00:13:17.500
You just ask in natural language. What else you got for us, Esha?

240
00:13:18.220 --> 00:13:21.860
One more thing that I wanted to show that I'm very proud of our team accomplishing

241
00:13:21.940 --> 00:13:25.920
is this topology view. This is a live physical

242
00:13:25.940 --> 00:13:29.420
map of all of your sites and assets across your Cisco real estate

243
00:13:29.760 --> 00:13:33.580
correlated and connected. And let me tell you, every site, every

244
00:13:33.700 --> 00:13:37.620
device, every edge is clickable. And this left-hand side

245
00:13:37.760 --> 00:13:41.620
pane actually dynamically changes when you go deeper into those

246
00:13:41.700 --> 00:13:43.680

views. So let's take

247
00:13:44.560 --> 00:13:48.450
my London office, for example. I can dive in from this map, and

248
00:13:48.520 --> 00:13:52.180
it tells me all of the assets that are a part of my London office.

249
00:13:52.300 --> 00:13:52.490
That's pretty cool.

250
00:13:52.520 --> 00:13:55.980
I can click into each one of them, see which devices are unreachable,

251
00:13:56.460 --> 00:14:00.350
and also what alerts are on which devices, and how to resolve these errors right

252
00:14:00.380 --> 00:14:04.280
from here. And what's also amazing, it not just shows you that

253
00:14:04.400 --> 00:14:08.300
site's asset allocation, but which other sites it's connected to.

254
00:14:08.340 --> 00:14:11.780
So this London office, like you can see, is connected to São Paulo, so I can jump

255
00:14:11.820 --> 00:14:15.280
into São Paulo right from here without even exiting out into the map.

256
00:14:15.420 --> 00:14:17.640
Oh, that's really neat, especially for an operator.

257
00:14:17.690 --> 00:14:21.580
This is going to be super important to have a visual representation of how

258
00:14:21.680 --> 00:14:25.590
all of their devices are connected and be able to go from one site to another

259
00:14:25.600 --> 00:14:26.940
without having to lose context.

260
00:14:26.950 --> 00:14:28.280
That's absolutely right.

261
00:14:28.320 --> 00:14:29.960
Esha, this is super cool.

262
00:14:30.000 --> 00:14:31.660
There's one more thing I want to leave you with.

263
00:14:31.940 --> 00:14:33.080
All right. What do you got?

264
00:14:33.360 --> 00:14:36.280
You've already spoken about this a little bit, but I just wanted to double-click

265
00:14:36.320 --> 00:14:40.100
into it because this marketplace experience is

266
00:14:40.160 --> 00:14:43.300
where it goes beyond just the Cisco estate.

267
00:14:43.940 --> 00:14:47.760
This is where all of you, all our partners, can bring in

268
00:14:47.780 --> 00:14:51.430
their apps, agents, integrations, and tap into it

269
00:14:51.440 --> 00:14:55.420
directly from this interface and connect it natively so that cloud control

270
00:14:55.500 --> 00:14:57.540
has access to data across the system.

271
00:14:57.600 --> 00:15:00.660
So we're actually bringing the tools to the operator and not the other way around

272
00:15:00.720 --> 00:15:00.940
now.

273
00:15:01.460 --> 00:15:04.800
Esha, that's so important, and I'm glad that you reminded me of this.

274
00:15:04.860 --> 00:15:08.829
And most of you, I use ServiceNow all the time, and

275
00:15:08.860 --> 00:15:11.520
I'm glad to see ServiceNow and BlueCat right up there.

276
00:15:11.620 --> 00:15:11.829
And

277
00:15:12.940 --> 00:15:16.480
I see Amazon, I see Google. We've got some pretty big names.

278
00:15:16.560 --> 00:15:16.940
That's right.

279
00:15:16.960 --> 00:15:20.080
And we've got some new startups over there as well.

280
00:15:20.160 --> 00:15:21.980
I thought I saw Linear if you scroll down a little bit.

281
00:15:23.020 --> 00:15:26.620
So we've got a mix of startups, large companies, hyperscalers.

282
00:15:26.780 --> 00:15:28.080
We've partnered with a lot of-

283
00:15:28.169 --> 00:15:28.190
That's right

284
00:15:28.190 --> 00:15:31.620
... meaningful partners that I think you all will appreciate from an ecosystem

285
00:15:31.680 --> 00:15:32.160
perspective.

286
00:15:33.200 --> 00:15:33.580
So cool.

287
00:15:33.940 --> 00:15:34.060
Yeah.

288
00:15:34.400 --> 00:15:34.410
Esha.

289
00:15:34.420 --> 00:15:35.880
And we're just getting started, DJ.

290
00:15:36.140 --> 00:15:36.860
That's amazing.

291
00:15:36.900 --> 00:15:39.920
It's an exciting moment for all of us, and I can't wait to see all of you
in

292
00:15:39.960 --> 00:15:41.030
controlled availability. So come sign up.

293
00:15:41.060 --> 00:15:43.780
Thank you so much, Esha. Please put your hands together for Esha.

294
00:15:48.930 --> 00:15:49.580
Mr. Barton.

295
00:15:49.980 --> 00:15:50.300
DJ.

296
00:15:50.560 --> 00:15:51.260
How's it going, sir?

297
00:15:51.380 --> 00:15:51.960
Doing very well.

298

00:15:52.320 --> 00:15:53.310
Good to see you up here on stage.

299
00:15:53.310 --> 00:15:53.660
Likewise.

300
00:15:53.860 --> 00:15:57.060
For those of you who didn't know, Rob was my backup man,

301
00:15:57.960 --> 00:16:01.140
behind the scenes making sure my demo goes well. So Rob, what you got for me?

302
00:16:02.000 --> 00:16:04.240
So I want to show you a little more about cloud control.

303
00:16:04.880 --> 00:16:06.389
So you know how Esha talked about the

304
00:16:07.560 --> 00:16:09.620
assistant, the canvas, the Actions tabs?

305
00:16:10.080 --> 00:16:13.060
When you look into the Actions tab, you see there's a red dot there.

306
00:16:13.680 --> 00:16:16.580
That tells you something's going on that the operator needs to look at.

307
00:16:16.620 --> 00:16:18.200
There's something that demands your attention.

308
00:16:18.820 --> 00:16:22.780
So in cloud control, what we've done is we intelligently look at

309
00:16:22.840 --> 00:16:25.280
the alerts coming in, we organize them through AI-

310
00:16:25.500 --> 00:16:25.660
Mm-hmm

311
00:16:25.760 --> 00:16:29.260

... and it points you directly to say, "This is something that you got to look at.

312
00:16:29.310 --> 00:16:32.540
There's something happening." So in this case, we see that there's a critical

313
00:16:32.680 --> 00:16:34.000
wireless onboarding failure-

314
00:16:34.340 --> 00:16:34.460
Yeah

315
00:16:34.580 --> 00:16:37.280
... in London, and it's related to Catalyst Center.

316
00:16:37.460 --> 00:16:39.960
So this is something-- Okay, London's a big office.

317
00:16:40.060 --> 00:16:40.340
That's right.

318
00:16:40.700 --> 00:16:44.560
So there's something happening. Network could be down, and it says, "Go in there

319
00:16:44.640 --> 00:16:45.280
and check it out."

320
00:16:45.739 --> 00:16:48.840
Let's go check it out. By the way, folks, when a network goes down, one of the

321
00:16:48.860 --> 00:16:52.660
things that I know about each and every single one of you that's an operator

322
00:16:53.280 --> 00:16:56.760
is that it's never fun. Your phone start buzzing, you start getting

323
00:16:56.780 --> 00:16:58.920
notifications, you have lots of issues coming up.

324
00:16:58.980 --> 00:17:02.880
So, how do we help our operators? Let's get into

325
00:17:02.920 --> 00:17:03.020
it.

326
00:17:03.100 --> 00:17:04.901
Yeah. This is a high-pressure situation.

327
00:17:04.980 --> 00:17:07.520
So I'm going to click on Collaborate in canvas,

328
00:17:08.401 --> 00:17:11.000
and it immediately takes us into AI Canvas.

329
00:17:11.940 --> 00:17:14.080
And on the left-hand side, so we have

330
00:17:15.181 --> 00:17:15.540
the

331
00:17:17.040 --> 00:17:18.401
chat that's on the left-hand side here.

332
00:17:18.921 --> 00:17:22.060
So this tells us a little bit what's going on. It just imported that
alert.

333
00:17:22.360 --> 00:17:22.500
Mm-hmm.

334
00:17:22.820 --> 00:17:26.800
And immediately it ran a health check to find out what's going on

335
00:17:26.860 --> 00:17:28.480
there in London. Is there really something happening?

336
00:17:28.520 --> 00:17:29.880
And sure enough, it says, "Hey, we've got

337
00:17:30.720 --> 00:17:34.680
610 DHCP failures, 650 clients have

338
00:17:34.800 --> 00:17:35.180
failed."

339
00:17:36.040 --> 00:17:36.820
This is pretty serious.

340
00:17:37.020 --> 00:17:40.760
Hang on, 650 clients. That's 650 iPhones, 650

341
00:17:40.840 --> 00:17:43.300
possible laptops that are not connecting to Wi-Fi.

342
00:17:43.340 --> 00:17:45.080
These are people working that cannot work.

343
00:17:45.360 --> 00:17:47.379
This is catastrophic. All right, so what do we do next?

344
00:17:47.740 --> 00:17:51.260
So if I'm the network operator, the first thing I'm going to think about
is, is

345
00:17:51.300 --> 00:17:52.070
this just London-

346
00:17:52.400 --> 00:17:52.450
Yeah

347
00:17:52.480 --> 00:17:54.260
... or are we being impacted globally?

348
00:17:54.280 --> 00:17:54.410
Mm-hmm.

349
00:17:54.460 --> 00:17:56.720
So we need to first just nail it down.

350

00:17:56.780 --> 00:17:58.860
So I'm going to go into the prompt here

351
00:18:00.180 --> 00:18:03.940
in the chat in AI Canvas and using the prompt grammar, so this forward

352
00:18:04.000 --> 00:18:07.820
slash that people are becoming used to, I'm going to go down to discovery and

353
00:18:07.880 --> 00:18:11.500
inventory, and I'm going to list out all the networks that we have globally.

354
00:18:11.540 --> 00:18:15.470
These are both Meraki and Catalyst Center networks, and it's going

355
00:18:15.480 --> 00:18:17.820
to give us a snapshot what's happening.

356
00:18:18.380 --> 00:18:21.280
So it's using this network overview agent, if you see in this box.

357
00:18:21.500 --> 00:18:24.840
So this is a special agent that knows how to collect inventory

358
00:18:24.880 --> 00:18:27.320
information and tell us the health of the network.

359
00:18:28.532 --> 00:18:31.312
And Rob, we have a multi-agent architecture underneath, correct?

360
00:18:31.552 --> 00:18:35.312
And it's not just a single agent, it's a lot of these agents are constantly

361
00:18:35.372 --> 00:18:37.792
talking to each other, and then they're coming back.

362
00:18:37.822 --> 00:18:41.772
That's what's sort of generating the UI widgets that we see on top.

363
00:18:42.092 --> 00:18:44.132
Can you just go back to the one that you just minimized on top?

364
00:18:44.212 --> 00:18:44.692
I just want to-

365
00:18:44.712 --> 00:18:44.782
Yep

366
00:18:44.852 --> 00:18:48.842
... point out one other thing. You'll notice that this data that

367
00:18:48.872 --> 00:18:52.852
is being generated by that UI is actually coming in based

368
00:18:52.952 --> 00:18:55.192
off of the context that it already has.

369
00:18:55.232 --> 00:18:58.532
So it's not the same as a static dashboard that you would normally see.

370
00:18:59.072 --> 00:19:02.992
You're basically seeing a dynamic widget be generated based

371
00:19:03.052 --> 00:19:03.932
on the context of what

372
00:19:04.752 --> 00:19:05.312
went into it.

373
00:19:06.112 --> 00:19:08.212
All right. So that assistant's taking a little longer than it should have.

374
00:19:08.252 --> 00:19:09.712
So this is the fun part of doing live demos-

375
00:19:09.992 --> 00:19:10.262
That's right

376

00:19:10.262 --> 00:19:11.472
... because this is actually a live demo.

377
00:19:12.152 --> 00:19:15.092
This should actually come back in about five seconds, but it seems to be thinking a

378
00:19:15.112 --> 00:19:16.312
little longer. I'm just going to stop it.

379
00:19:17.082 --> 00:19:18.992
But we know that this is a problem in London.

380
00:19:19.052 --> 00:19:22.152
So at this point, I'm thinking, is there a ticket?

381
00:19:22.232 --> 00:19:22.452
Right.

382
00:19:22.492 --> 00:19:26.292
There should be a ticket, for this issue. So we got to see if we have a ticket.

383
00:19:26.442 --> 00:19:29.812
So one of the things that I usually show you is this, these partnerships we have in

384
00:19:29.832 --> 00:19:30.492
our marketplace.

385
00:19:30.632 --> 00:19:30.772
Mm-hmm.

386
00:19:30.932 --> 00:19:32.732
And one of our partners is ServiceNow.

387
00:19:33.391 --> 00:19:36.092
So in a good network, ServiceNow would have created an issue.

388
00:19:36.162 --> 00:19:36.812
So-

389
00:19:36.852 --> 00:19:36.862
That's right

390
00:19:36.862 --> 00:19:40.652
... we've integrated it, which means it's actually wired up into Cloud Control,

391
00:19:41.372 --> 00:19:43.392
which means we can talk to it from AI Canvas.

392
00:19:43.552 --> 00:19:44.152
Oh, let's see it.

393
00:19:44.192 --> 00:19:46.092
So let me put in a prompt. Let's

394
00:19:47.532 --> 00:19:47.932
try this one.

395
00:19:55.672 --> 00:19:59.412
Let's see. Wi-Fi issues in London.

396
00:19:59.852 --> 00:20:03.812
So you're not posting, or you're not essentially pasting a ticket or an

397
00:20:03.872 --> 00:20:07.372
issue number or anything else. You're basically just saying, "Hey, listen, go to

398
00:20:07.412 --> 00:20:10.872
ServiceNow and check if there are any active Wi-Fi issues."

399
00:20:11.152 --> 00:20:13.872
And at this point in time, it's talking to ServiceNow.

400
00:20:14.072 --> 00:20:17.932
And we'll see if this one comes back up, unless you might have to

401
00:20:17.992 --> 00:20:19.012
just do a hard refresh.

402
00:20:19.152 --> 00:20:20.492
No, no, we're working here.

403
00:20:20.502 --> 00:20:20.502
That's what I'm going to do. Oh.

404
00:20:20.512 --> 00:20:22.271
And did you notice I talked to the ServiceNow agent?

405
00:20:22.712 --> 00:20:23.792
It actually brought up that agent.

406
00:20:23.852 --> 00:20:27.812
So ServiceNow actually knows how to handle this request from

407
00:20:27.852 --> 00:20:31.712
AI Canvas. So it took that information that we had from the event,

408
00:20:32.052 --> 00:20:34.772
sent it to ServiceNow, and it gave us a bit of a report here.

409
00:20:36.012 --> 00:20:36.112
So-

410
00:20:36.122 --> 00:20:36.742
Oh, let's take a look at that

411
00:20:37.552 --> 00:20:41.332
... so yeah, we have a ticket. So, it looks like ServiceNow did create a

412
00:20:41.372 --> 00:20:41.612
ticket.

413
00:20:42.432 --> 00:20:46.072
So the top one here, alert detail. Oh, this is interesting.

414
00:20:46.152 --> 00:20:49.872
So the ServiceNow agent has given us a little more context.

415
00:20:49.912 --> 00:20:53.852

It says there is a similar incident on

416
00:20:53.932 --> 00:20:56.852
April 8, 2026, in the Dallas office.

417
00:20:57.292 --> 00:21:01.232
So there's this agent that ServiceNow has, the ITOM agent, so it's

418
00:21:01.312 --> 00:21:03.132
able to correlate similar events.

419
00:21:03.182 --> 00:21:07.132
If it thinks there's something similar between this one and another one, it's

420
00:21:07.152 --> 00:21:10.392
going to tell you about this because it thinks this could be what's happening now.

421
00:21:11.052 --> 00:21:14.932
So it says, in this case, we had an IPAM migration

422
00:21:15.072 --> 00:21:18.812
issue back in this Dallas office. So that's your IP address

423
00:21:18.832 --> 00:21:22.332
management system, manages DHCP. It thinks maybe that's the problem.

424
00:21:22.792 --> 00:21:25.312
And that's a good clue, right? For us to be able to start digging into this.

425
00:21:25.472 --> 00:21:26.512
A very important clue. Yeah.

426
00:21:26.572 --> 00:21:26.852
All right.

427
00:21:27.812 --> 00:21:31.722
Now, not all the signals are going to come from things like tickets,

428

00:21:32.292 --> 00:21:33.532
or they're going to come from events.

429
00:21:33.572 --> 00:21:36.712
Sometimes people will send you email, or they're going to text you.

430
00:21:36.972 --> 00:21:40.952
So we have to be flexible enough to allow these other signals to be

431
00:21:40.972 --> 00:21:43.032
incorporated into AI Canvas.

432
00:21:43.302 --> 00:21:46.612
So how do we go about doing that? Because I know for a fact that, in a situation

433
00:21:46.652 --> 00:21:48.592
like this, you're going to get text messages.

434
00:21:48.952 --> 00:21:51.072
You might get an email that says, "Hey, here's what's going on."

435
00:21:51.892 --> 00:21:53.822
Is there a way for you to be able to connect that seamlessly here?

436
00:21:53.892 --> 00:21:56.932
Yeah. Let's take an example here. So, we have our Alfred.

437
00:21:56.992 --> 00:22:00.722
He's our network manager in London. So, Alfred just sent this email.

438
00:22:01.352 --> 00:22:04.772
So, if we take a look at this, Alfred looks pretty concerned.

439
00:22:05.072 --> 00:22:06.972
He says, "Emergency.

440
00:22:08.132 --> 00:22:11.192
Team, our network is having a major issue.

441
00:22:11.312 --> 00:22:12.152

I can't get online,

442
00:22:13.732 --> 00:22:17.352
so I'm sending this email from a pub in central London."

443
00:22:17.412 --> 00:22:20.752
I love the person's instinct when something doesn't work, let's go to a pub in

444
00:22:20.792 --> 00:22:21.232
London.

445
00:22:22.212 --> 00:22:23.712
Alfred goes to the pub for any excuse.

446
00:22:23.752 --> 00:22:24.712
There you go.

447
00:22:24.752 --> 00:22:27.352
So he says, "We've got a serious network issue on our London network.

448
00:22:27.412 --> 00:22:30.512
More than 600 of our users can't get on Wi-Fi.

449
00:22:31.452 --> 00:22:35.042
But strangely, about 200 users can connect, so it's not like our full site is

450
00:22:35.072 --> 00:22:38.712
down. Something is definitely wrong. We need to get back online ASAP.

451
00:22:38.932 --> 00:22:42.652
Help." So Alfred's pretty concerned here.

452
00:22:43.292 --> 00:22:46.252
I think this is also a very interesting clue, Robert.

453
00:22:46.372 --> 00:22:49.712
I think a lot of times when people are just pinging you, you get nuggets of

454

00:22:49.771 --> 00:22:51.032
information from different parts.

455
00:22:51.112 --> 00:22:54.132
Actually, you're right. There is some detail in there that we could use.

456
00:22:54.392 --> 00:22:57.952
Let's go back to our troubleshooting, and let's see if we can use some of that.

457
00:22:57.992 --> 00:22:59.792
So I actually just took a screenshot

458
00:23:00.732 --> 00:23:04.552
of what Alfred sent us, his email. And I'm using a multimodal

459
00:23:04.732 --> 00:23:07.632
capability here in AI Canvas to drop in that email itself,

460
00:23:08.262 --> 00:23:11.752
and the model's going to read the email. So I'm going to ask it to...

461
00:23:12.212 --> 00:23:14.212
So I'm attaching.

462
00:23:15.972 --> 00:23:19.372
Right. While you're typing that, folks, what we mean by multimodal

463
00:23:19.852 --> 00:23:23.692
is when you have an AI tool that you're using, normally you're interfacing with

464
00:23:23.732 --> 00:23:26.092
it using text-based communications.

465
00:23:26.192 --> 00:23:29.812
But sometimes you might want to paste an image, or you might want to record an

466
00:23:29.872 --> 00:23:33.482
audio feed. Our AI models that are supporting

467
00:23:33.532 --> 00:23:37.232
Canvas right now are multimodal in nature, so you can easily just grab

468
00:23:37.752 --> 00:23:40.112
a screenshot of that email and paste it over here.

469
00:23:40.652 --> 00:23:44.612
And when you give it a prompt with that question, it's going to be able to consume

470
00:23:44.672 --> 00:23:47.552
that and make sense of it and start using that as part of its

471
00:23:48.212 --> 00:23:48.841
context.

472
00:23:48.841 --> 00:23:52.452
Yeah, exactly. So I put in the image of the email, and I said, "I'm

473
00:23:52.492 --> 00:23:56.432
attaching an email from Alfred, our manager in London. Use it for context.

474
00:23:56.572 --> 00:24:00.032
Please troubleshoot the networking issues in London." But I'm going to do something

475
00:24:00.112 --> 00:24:03.132
special here. I'm going to go into something called reasoning mode.

476
00:24:03.212 --> 00:24:03.832
Ooh.

477
00:24:03.892 --> 00:24:07.492
And I'm going to flip it over, and I'm going to start to analyze this prompt.

478
00:24:08.341 --> 00:24:09.812
And this is going to do something really unique.

479
00:24:10.572 --> 00:24:11.592

What's a reasoning mode?

480
00:24:11.652 --> 00:24:15.472
Yeah. So reasoning is one of the most, I think, interesting things about

481
00:24:15.512 --> 00:24:18.962
how AI Canvas works. In reasoning mode, we take

482
00:24:19.012 --> 00:24:21.212
complex situations, and this is complex, right?

483
00:24:21.232 --> 00:24:24.332
We've got signals from the Catalyst Center events.

484
00:24:24.392 --> 00:24:27.732
We've got the ServiceNow ticket. We've got the email from Alfred.

485
00:24:27.752 --> 00:24:30.512
And troubleshooting is never simple. This is a complex thing.

486
00:24:30.572 --> 00:24:30.972
Right.

487
00:24:31.032 --> 00:24:34.962
So what reasoning mode is, it puts the backend models into a different

488
00:24:34.992 --> 00:24:37.692
mode where it actually thinks about the problem.

489
00:24:38.522 --> 00:24:41.272
And how would I analyze this? It's like a CCIE, right?

490
00:24:42.002 --> 00:24:45.942
Before they start working, they think about the problem, and they plan it out.

491
00:24:46.042 --> 00:24:49.322
So deep reasoning allows us to think about the problem, put a

492
00:24:49.382 --> 00:24:52.852
multi-stage plan together, and what it will do in the back

493
00:24:52.942 --> 00:24:55.942
end is it will start to spin up agents.

494
00:24:55.962 --> 00:24:55.972
Mm.

495
00:24:56.202 --> 00:24:57.682
And these agents have different functions.

496
00:24:57.722 --> 00:25:01.262
So it says, "I need an agent to go and get more telemetry data." So it'll go

497
00:25:01.642 --> 00:25:03.262
and pull something from Catalyst Center.

498
00:25:03.292 --> 00:25:05.182
Another agent will go get something from ThousandEyes.

499
00:25:05.762 --> 00:25:08.782
And then it's going to have another agent that starts to even write code that

500
00:25:08.792 --> 00:25:12.682
parses out all of this data. And then another one, which is trying to use this

501
00:25:12.702 --> 00:25:15.962
knowledge base to come to a conclusion. These are like temporal agents.

502
00:25:16.002 --> 00:25:17.662
They didn't exist two seconds ago.

503
00:25:17.702 --> 00:25:21.332
It spins them up on the fly, and when it's done, it gives you an answer, and

504
00:25:21.342 --> 00:25:24.092
they're done. Actually, if you look here, it's already putting its plan together,

505
00:25:24.642 --> 00:25:25.622
and it says diagnose-

506
00:25:25.642 --> 00:25:26.402
Oh, look at that.

507
00:25:26.422 --> 00:25:29.842
Yep. So here's the plan. So reading the email to extract the symptoms.

508
00:25:30.362 --> 00:25:33.842
So it's going to go through this. Now, it's going to take a little bit of time, but

509
00:25:33.882 --> 00:25:36.402
when it's done, it's going to hopefully give us an answer.

510
00:25:36.662 --> 00:25:38.902
I love when a checklist comes together, right?

511
00:25:39.002 --> 00:25:42.982
And right here, the model is doing exactly that, puts a checklist and says, "Okay,

512
00:25:43.022 --> 00:25:44.632
I'm going to get through each and every single one of these

513
00:25:45.522 --> 00:25:49.302
plans." Now, some of these things it takes a little while, right?

514
00:25:49.322 --> 00:25:52.002
Hey, whoa, whoa, whoa, DJ, I think there's something that you need to come see

515
00:25:52.082 --> 00:25:52.862
right now.

516
00:25:52.872 --> 00:25:53.512
Whoa, what's going on?

517
00:25:53.802 --> 00:25:57.112

I was working in Cloud Control, and I noticed an actions that just came in that

518
00:25:57.142 --> 00:26:00.902
says Critical CVE Exposure in Las Vegas Data Center Fabric.

519
00:26:01.402 --> 00:26:04.972
Whoa. Hang on. For those of you who don't know, CVEs are common vulnerability

520
00:26:05.002 --> 00:26:08.762
exposures. Now, this is basically a database of vulnerabilities that are publicly

521
00:26:08.772 --> 00:26:11.582
disclosed and are available. So that sounds pretty bad.

522
00:26:11.622 --> 00:26:15.492
Yeah. In fact, what it says right here is that it's affecting our Nexus 9000

523
00:26:15.542 --> 00:26:19.142
ACI switches on two fabrics within one of our critical Las

524
00:26:19.222 --> 00:26:22.862
Vegas data centers that's connected to many of our powerful

525
00:26:22.902 --> 00:26:26.082
GPU servers powering our agentic technology. This is serious.

526
00:26:26.122 --> 00:26:28.232
It is. Come on, what do we do about this?

527
00:26:28.402 --> 00:26:32.242
Yeah. So what I'm thinking is that we can go ahead and hit Collaborate in Canvas

528
00:26:32.322 --> 00:26:36.172
up here, and just like what Rob did earlier, we can bring the context directly

529
00:26:36.222 --> 00:26:39.582

into AI Canvas. Earlier, if you noticed, what it said was that

530
00:26:39.662 --> 00:26:42.892
authenticated SNMP attackers, if they get into the Nexus switches-

531
00:26:43.062 --> 00:26:43.172
Mm-hmm

532
00:26:43.172 --> 00:26:45.982
... they can cause a kernel panic, causing a reload.

533
00:26:46.342 --> 00:26:50.282
So what we're going to do here is that Canvas, luckily, is connected to

534
00:26:50.292 --> 00:26:54.242
many agents underneath. In this case, it's routing directly to a compliance agent,

535
00:26:54.642 --> 00:26:58.502
which is connected to this data center, and it's going to be able to look into

536
00:26:58.602 --> 00:27:01.912
all the devices within that data center to see whether or not they're

537
00:27:01.942 --> 00:27:02.882
adhering to-

538
00:27:02.892 --> 00:27:02.892
Mm

539
00:27:02.892 --> 00:27:05.081
... the internal as well as standardized policies.

540
00:27:05.122 --> 00:27:09.051
And as you can see, it seems to have come back with a whole entire topology as well

541
00:27:09.082 --> 00:27:12.322
as response, highlighting which ones are vulnerable and which ones are not.

542
00:27:12.352 --> 00:27:14.252
That's super cool, first of all. And

543
00:27:15.082 --> 00:27:17.532
one of the interesting things, folks, notice is that

544
00:27:18.522 --> 00:27:22.062
Canvas as a tool is fundamentally a cross-domain troubleshooting tool.

545
00:27:22.902 --> 00:27:25.282
You could be using it to troubleshoot network

546
00:27:26.222 --> 00:27:29.592
assets. You could use it to be able to troubleshoot your security problems, and

547
00:27:29.622 --> 00:27:30.762
that's what you're seeing over here.

548
00:27:30.802 --> 00:27:34.762
It actually created a generative UI with a topological view with a

549
00:27:34.802 --> 00:27:38.732
list of the alerts so that now you can start drilling into this in a

550
00:27:38.762 --> 00:27:39.252
deeper fashion.

551
00:27:39.622 --> 00:27:40.062
Exactly.

552
00:27:40.862 --> 00:27:43.062
But there's a lot going on over here. Simplify this for me.

553
00:27:43.122 --> 00:27:46.662
Absolutely. So what I'm seeing right here is that it says the vulnerable

554
00:27:46.702 --> 00:27:49.762
releases is the 16.1.3F and 16.1.4H.

555

00:27:50.222 --> 00:27:53.702
But look at this, it says that there's already been a fixed release up

556
00:27:54.102 --> 00:27:57.952
here, and down here it says the permanent fix would be for us to go ahead and

557
00:27:57.982 --> 00:28:01.362
upgrade those Nexus switches to the latest firmware. What do you think about that?

558
00:28:01.482 --> 00:28:05.271
I think that makes a ton of sense. And the fact is that when you think about

559
00:28:05.322 --> 00:28:09.062
upgrading your firewall, your firmware of your

560
00:28:09.082 --> 00:28:11.502
devices, these things take a long amount of time.

561
00:28:11.562 --> 00:28:14.702
So the fact that it's also come back with a immediate fix

562
00:28:15.242 --> 00:28:16.902
sounds really, really interesting.

563
00:28:16.962 --> 00:28:18.952
Now, one other thing to keep in mind is this, right?

564
00:28:20.062 --> 00:28:22.742
These agents are not just ones where you're interacting back and forth.

565
00:28:22.822 --> 00:28:25.082
These agents are constantly running in an ambient mode.

566
00:28:25.122 --> 00:28:26.782
That's what triggered this whole alert.

567
00:28:26.842 --> 00:28:27.602
Exactly.

568
00:28:27.612 --> 00:28:27.612
Right?

569
00:28:27.622 --> 00:28:28.462
That's exactly it.

570
00:28:28.522 --> 00:28:28.722
Cool.

571
00:28:29.092 --> 00:28:31.802
But instead of actually going to do that immediate fix of updating that firmware,

572
00:28:32.162 --> 00:28:36.142
because way that we know, when it comes to data centers, it's nearly impossible to

573
00:28:36.202 --> 00:28:37.262
find a maintenance window.

574
00:28:37.482 --> 00:28:37.742
That's right.

575
00:28:37.842 --> 00:28:41.402
What I also notice down here is that there's an immediate fix that it has

576
00:28:41.422 --> 00:28:44.742
suggested to update the ACL on the firewall.

577
00:28:44.782 --> 00:28:48.222
In fact, what we notice right here is that there is a firewall sitting between the

578
00:28:48.242 --> 00:28:49.522
data center and the internet.

579
00:28:49.562 --> 00:28:49.762
Mm.

580
00:28:49.892 --> 00:28:53.722
And it says right here that right now, currently, the ACL is allowing

581
00:28:53.782 --> 00:28:57.472
any IP addresses to go through the UDP port 161,

582
00:28:57.741 --> 00:29:01.202
which for those who are not aware, is what allows us to go and access

583
00:29:01.322 --> 00:29:01.882
SNMP.

584
00:29:02.262 --> 00:29:02.562
That's right.

585
00:29:02.742 --> 00:29:06.202
So what we can do instead is it's suggesting a workaround for the time being that

586
00:29:06.242 --> 00:29:09.982
allows us to be able to change that access control list within the firewall

587
00:29:10.242 --> 00:29:14.202
to make it so that it's only allowing management networks instead to go through the

588
00:29:14.242 --> 00:29:16.842
firewall, therefore protecting us for the time being.

589
00:29:17.122 --> 00:29:20.662
Richard, that sounds a lot more reasonable, as opposed to trying to

590
00:29:20.722 --> 00:29:22.722
change the firmware for all of the devices.

591
00:29:22.762 --> 00:29:24.992
So why don't we go ahead and do that?

592
00:29:25.022 --> 00:29:28.222
Yeah. So what I can do here is I can type in, "Can you

593
00:29:28.262 --> 00:29:29.922

generate a workflow

594
00:29:31.362 --> 00:29:35.242
to remediate this CVE?" And DJ, normally,

595
00:29:35.422 --> 00:29:38.282
we would need to go to the firewall team, probably file a few tickets, bring

596
00:29:38.322 --> 00:29:41.862
everybody up to context, but what we're doing here is we're actually routing this

597
00:29:41.902 --> 00:29:45.762
directly to a workflows agent that's also integrated directly with AI

598
00:29:45.882 --> 00:29:46.381
Canvas.

599
00:29:47.022 --> 00:29:49.162
Hang on a second. So this is really important, folks.

600
00:29:49.502 --> 00:29:53.402
So far, a lot of the demos that you are seeing so far were information

601
00:29:53.442 --> 00:29:57.202
that was coming into the canvas, but this is the first time where we're

602
00:29:57.282 --> 00:30:00.922
about to take an action that changes the state of your system.

603
00:30:01.402 --> 00:30:03.282
So back to you, Richard. How are you going to make this change?

604
00:30:03.542 --> 00:30:06.742
Yeah. So the great part about this is that we all know that at the end of the day,

605
00:30:06.842 --> 00:30:10.312
LLMs and agents have some degree of dynamicness.

606

00:30:10.342 --> 00:30:13.782
So what we want to make sure is that when it comes to configuration, we are making

607
00:30:13.802 --> 00:30:17.122
it more prescriptive. We're going to keep you all in the loop so you can all be

608
00:30:17.182 --> 00:30:20.522
here to understand the configurations and review it before they actually take

609
00:30:20.542 --> 00:30:24.442
place. And if you take a look at this right here, you can see that it

610
00:30:24.502 --> 00:30:27.882
created an entire workflow for you for modifying that firewall management center

611
00:30:28.202 --> 00:30:31.502
access control rule for specifically restricting SNMP.

612
00:30:32.082 --> 00:30:34.702
And down here, it created six different steps.

613
00:30:34.762 --> 00:30:38.232
First, starting from getting the FMC information, the domain information,

614
00:30:38.702 --> 00:30:42.662
checking to see whether or not the management network object actually exists, then

615
00:30:42.762 --> 00:30:45.902
finding the actual access control list rule, modifying it,

616
00:30:46.322 --> 00:30:49.962
deploying it, and then ultimately verifying it to make sure that it actually has

617
00:30:50.002 --> 00:30:53.542
taken place. I mean, DJ, this looks pretty rock solid. Should we go for it?

618
00:30:53.842 --> 00:30:55.962
Hang tight. Let's take a quick step back, folks.

619
00:30:56.042 --> 00:30:58.122
I want you all to understand what just happened here.

620
00:30:59.042 --> 00:31:03.022
AI is fundamentally non-deterministic in nature,

621
00:31:04.302 --> 00:31:07.511
but a lot of times when you want AI to make changes to your critical

622
00:31:07.562 --> 00:31:11.032
infrastructure, you want it to follow step-by-step detailed

623
00:31:11.062 --> 00:31:13.202
instructions, and that's what you're seeing over here.

624
00:31:13.522 --> 00:31:17.452
We've integrated this with our workflows engine that allows you to

625
00:31:17.542 --> 00:31:20.302
specify exactly how you want AI to operate.

626
00:31:20.662 --> 00:31:24.542
You could choose a completely deterministic mode, or you could choose a

627
00:31:24.602 --> 00:31:27.242
completely automated mode, and it's a slider.

628
00:31:27.622 --> 00:31:31.422
You can toggle that slider as you like it, and that is

629
00:31:31.602 --> 00:31:33.782
really, really key. Back to you.

630
00:31:33.862 --> 00:31:36.642
Absolutely. So let's go ahead and try this out.

631
00:31:36.682 --> 00:31:37.162

Let's do it.

632
00:31:37.182 --> 00:31:40.262
What I'm going to do, because you gave the green light, is I'm going to hit Approve

633
00:31:40.282 --> 00:31:43.892
and then hit Execute, and just like that, it's going to go through step by step,

634
00:31:44.182 --> 00:31:47.842
and along the way, it's telling you that it's completed every single step, and once

635
00:31:47.862 --> 00:31:50.542
it gets through steps one through six, it means that we've

636
00:31:50.622 --> 00:31:54.162
successfully been able to mitigate this vulnerability in

637
00:31:54.242 --> 00:31:55.462
our data center.

638
00:31:55.942 --> 00:31:58.562
Awesome. Yeah. Put your hands together for Richard.

639
00:32:04.022 --> 00:32:07.522
That's how easy it is, folks, to be able to, when you receive an alert and when you

640
00:32:07.582 --> 00:32:10.922
have to debug and troubleshoot and then take an action, you can do it that

641
00:32:11.022 --> 00:32:13.352
quickly. Back to you, Rob. Are you still reasoning?

642
00:32:13.702 --> 00:32:16.921
So, reasoning is done. The eagle has landed. We're there.

643
00:32:17.062 --> 00:32:17.362
All right.

644
00:32:17.542 --> 00:32:17.622
Yeah.

645
00:32:17.662 --> 00:32:18.142
Fantastic.

646
00:32:18.322 --> 00:32:22.202
So, it actually completed, and it gave us a ton of information, and it

647
00:32:22.282 --> 00:32:25.952
also summarized this in some widgets on some cards on our

648
00:32:26.262 --> 00:32:28.442
canvas board. In fact, you see the world map down here?

649
00:32:28.482 --> 00:32:30.702
I'm sorry, I'm going to pause you here. I'm just going to point you to...

650
00:32:30.802 --> 00:32:31.982
Can you just zoom into the assistant?

651
00:32:32.062 --> 00:32:34.562
The assistant actually looked at that email, right?

652
00:32:35.142 --> 00:32:39.102
It actually said, "Hey, I triaged that email, and I was able to now look at

653
00:32:39.122 --> 00:32:42.302
the clue that that email provided," and it pieced the whole thing together.

654
00:32:42.662 --> 00:32:42.882
It did.

655
00:32:43.042 --> 00:32:43.802
How cool is that?

656
00:32:43.962 --> 00:32:44.062
Yeah.

657
00:32:44.362 --> 00:32:44.582
All right.

658
00:32:44.682 --> 00:32:48.502
That's what the multi-step reasoning is able to do, and it gave us

659
00:32:48.542 --> 00:32:51.302
some pretty good conclusive data. It created this widget.

660
00:32:51.862 --> 00:32:55.122
It says we have 906 people in London that are trying to get online,

661
00:32:55.662 --> 00:32:59.542
and Alfred's pretty bang on because it says 650 of them were not able

662
00:32:59.562 --> 00:33:03.302
to, 256 were. So yeah, it's definitely

663
00:33:03.482 --> 00:33:07.402
seeing the right problem, and just like you called out, here it's saying

664
00:33:07.502 --> 00:33:11.402
basically your problem is both of your DHCP servers

665
00:33:11.502 --> 00:33:13.182
there in London are exhausted.

666
00:33:13.382 --> 00:33:13.662
Mm.

667
00:33:13.822 --> 00:33:17.622
Which makes sense because we just upgraded to Blue Cat in London,

668
00:33:18.022 --> 00:33:19.362
and it probably wasn't configured right.

669
00:33:19.582 --> 00:33:19.822
Ah.

670

00:33:20.282 --> 00:33:20.362
Yeah.

671
00:33:20.402 --> 00:33:24.182
Most of the times, the issue turns out it's a configuration issue

672
00:33:24.242 --> 00:33:27.982
because you introduce brand-new dynamic systems, and it gets really

673
00:33:28.022 --> 00:33:30.382
challenging to be able to get everything coordinated.

674
00:33:30.462 --> 00:33:31.552
So what do we do about this, Rob?

675
00:33:31.602 --> 00:33:35.482
So let's go check the Blue Cat in London and

676
00:33:35.542 --> 00:33:36.862
see if it's configured right.

677
00:33:37.002 --> 00:33:38.542
And you're going to do that straight here from Canvas?

678
00:33:38.722 --> 00:33:41.522
Yeah. If it was a month ago, I'd call up Alfred and say, "Get back to the
office

679
00:33:41.532 --> 00:33:41.982
and go check."

680
00:33:42.242 --> 00:33:42.322
Yeah.

681
00:33:42.642 --> 00:33:43.722
But I can do it from Canvas.

682
00:33:43.822 --> 00:33:44.382
That's super cool.

683
00:33:44.462 --> 00:33:45.622

So let me put the prompt in.

684
00:33:55.462 --> 00:33:58.182
Are there any Blue Cat customers over here? Quick show of hands.

685
00:34:00.062 --> 00:34:01.982
All right. I see quite a few hands going up. All right.

686
00:34:03.402 --> 00:34:07.282
And you notice it's actually routing to a Blue Cat agent here.

687
00:34:07.362 --> 00:34:11.062
So with that marketplace, again, we've added it to cloud

688
00:34:11.112 --> 00:34:15.022
control, it's wired up, and now I can communicate directly to

689
00:34:15.062 --> 00:34:17.502
the Blue Cat IPM from AI Canvas.

690
00:34:17.682 --> 00:34:21.142
For those of you who don't know, IP address management, that's what IPAM stands

691
00:34:21.162 --> 00:34:23.102
for. And oh, looks like-

692
00:34:23.743 --> 00:34:24.482
Yeah, that's pretty fast

693
00:34:24.882 --> 00:34:27.002
Well, it's pretty fast, and it's 0 out of 256.

694
00:34:27.082 --> 00:34:30.542
Yeah, that means we've only got 256 addresses available in London.

695
00:34:30.783 --> 00:34:31.622
There's none left.

696
00:34:31.822 --> 00:34:31.942
Oh.

697
00:34:32.542 --> 00:34:33.362
So this is the problem.

698
00:34:33.562 --> 00:34:33.743
Okay.

699
00:34:33.982 --> 00:34:37.803
It actually tells us the detail. There are a pair of slash 25s, so this is why we

700
00:34:37.842 --> 00:34:39.283
have no more addresses left.

701
00:34:40.322 --> 00:34:41.803
All right. What are we going to do next?

702
00:34:41.822 --> 00:34:42.442
We've got to fix it.

703
00:34:42.783 --> 00:34:43.162
Let's do it.

704
00:34:43.402 --> 00:34:47.342
Yeah. So you know how Richard showed you automating networking automation

705
00:34:47.482 --> 00:34:50.263
control from AI Canvas? Well, we can do the same thing to

706
00:34:50.303 --> 00:34:53.322
third-party applications as well, like Blue Cat.

707
00:34:53.382 --> 00:34:57.172
So we can actually ask Blue Cat right from here to increase the scope.

708
00:34:57.762 --> 00:34:59.962
Folks, that is extremely powerful.

709
00:35:00.002 --> 00:35:03.752
What you just heard, what Rob said here was not only are you getting information

710
00:35:03.782 --> 00:35:07.172
from your third-party vendors that you're integrating into your ecosystem,

711
00:35:08.022 --> 00:35:11.752
it's bidirectional. You can push a message back out and get

712
00:35:11.862 --> 00:35:15.662
your other third-party vendors to be able to take actions

713
00:35:15.762 --> 00:35:18.362
on your behalf, all from Canvas.

714
00:35:18.802 --> 00:35:20.922
So I'm thinking 1,000 users. Is that about right?

715
00:35:21.252 --> 00:35:21.862
That sounds about right.

716
00:35:21.902 --> 00:35:22.442
All right, let's do it.

717
00:35:24.302 --> 00:35:25.622
There we go. It's talking to Blue Cat again.

718
00:35:28.902 --> 00:35:32.862
It's making configuration changes, talking to their agent, their

719
00:35:32.882 --> 00:35:33.802
agent's taking the job,

720
00:35:34.762 --> 00:35:37.982
and if all works, in a couple of seconds, we should have some results.

721
00:35:39.562 --> 00:35:43.402
And there it is. So it says the scope has now been

722
00:35:43.422 --> 00:35:46.022
increased. Oh, 1,024. Even better. So it's increased it.

723
00:35:46.282 --> 00:35:46.722
All right.

724
00:35:51.182 --> 00:35:54.062
Everybody likes some IP addresses, man, I'm telling you.

725
00:35:54.202 --> 00:35:55.682
It's not sexy, but it's important.

726
00:35:55.742 --> 00:35:56.152
It's really important.

727
00:35:56.182 --> 00:35:59.782
So a couple of slash 23s, and I

728
00:35:59.802 --> 00:36:03.622
think they're coming back online in London as we speak. Do you want to call Alfred?

729
00:36:03.682 --> 00:36:04.822
I think he needs to get back to the office.

730
00:36:05.062 --> 00:36:07.582
I need to get them all from the pubs back into the offices. Let's do it.

731
00:36:07.722 --> 00:36:08.482
They're back online.

732
00:36:08.542 --> 00:36:08.682
Yeah.

733
00:36:09.522 --> 00:36:10.582
But you earned a beer.

734
00:36:11.782 --> 00:36:12.362
That's a great idea.

735
00:36:12.702 --> 00:36:15.182
There you go. Awesome. Folks, put your hands together for Rob.

736

00:36:15.832 --> 00:36:17.682
Thank you.

737
00:36:21.442 --> 00:36:25.402
So what did we just see? We saw that from the demos, you now understand that

738
00:36:25.422 --> 00:36:28.282
we're unifying our management plane.

739
00:36:28.702 --> 00:36:32.362
We're making it easy for you to be able to troubleshoot across different domains.

740
00:36:33.438 --> 00:36:36.958
You have the ability to talk to third-party tools that are seamlessly

741
00:36:36.998 --> 00:36:40.618
integrating inside of Cloud Control and Canvas using

742
00:36:40.658 --> 00:36:41.188
Marketplace,

743
00:36:41.998 --> 00:36:42.798
and you can do this

744
00:36:43.698 --> 00:36:44.758
incredibly fast.

745
00:36:46.278 --> 00:36:49.118
That is the power of Cloud Control with AI Canvas.

746
00:36:50.318 --> 00:36:52.078
Now, I'd like to tell you one more thing that we're doing.

747
00:36:52.528 --> 00:36:54.508
And you heard us talk about this at the keynote,

748
00:36:55.758 --> 00:36:58.098
which is Cloud Control Studio.

749

00:37:00.058 --> 00:37:00.168
Now,

750
00:37:01.118 --> 00:37:04.118
we recognize that none of the tools

751
00:37:04.398 --> 00:37:08.118
off the shelf are going to be perfect fit for your environments.

752
00:37:09.138 --> 00:37:12.788
This is the reason why you use Ansible and

753
00:37:12.838 --> 00:37:16.798
Terraform and Python scripts to be able to help you with your automation

754
00:37:16.838 --> 00:37:20.718
journey to make sure that things seamlessly fit inside of your own

755
00:37:20.778 --> 00:37:21.218
workflows.

756
00:37:22.618 --> 00:37:26.238
What we decided to do was give you a tool to help you along that journey.

757
00:37:27.298 --> 00:37:31.018
We built the studio as a place for you to design and build

758
00:37:31.058 --> 00:37:34.918
agents and apps that are forged for your

759
00:37:34.978 --> 00:37:37.198
own environment. Now, with the Agent Builder,

760
00:37:38.578 --> 00:37:42.178
customers like yourselves and partners that help you on a day-to-day basis

761
00:37:42.958 --> 00:37:44.538
can build your own agents,

762
00:37:45.578 --> 00:37:48.958

and you can bring in third-party agents seamlessly.

763
00:37:48.998 --> 00:37:49.838
Now, this is really key.

764
00:37:51.258 --> 00:37:55.178
You can leverage your own data and your own intelligence to be able

765
00:37:55.238 --> 00:37:56.158
to fine-tune,

766
00:37:57.058 --> 00:38:00.938
build skills, and make sure that these agents understand exactly how you

767
00:38:00.978 --> 00:38:01.218
work.

768
00:38:03.058 --> 00:38:06.998
And we will ultimately help you run these agents in a safe and secure manner.

769
00:38:09.358 --> 00:38:12.678
The other thing that we also learned when we started talking to

770
00:38:13.538 --> 00:38:17.298
our customers was that in addition to building custom agents, they also

771
00:38:17.338 --> 00:38:21.318
wanted that first-class experience that they get from using Cloud Control

772
00:38:21.358 --> 00:38:23.718
by building their own custom applications.

773
00:38:25.658 --> 00:38:25.818
Now,

774
00:38:27.218 --> 00:38:31.168
we have a developer experience team that went out and said, "Hey, we're going

775
00:38:31.178 --> 00:38:34.878

to make it incredibly quick and incredibly fast for you to be able to build

776
00:38:35.678 --> 00:38:39.538
a custom app inside of Cloud Control, where you can use the SDK

777
00:38:39.918 --> 00:38:43.738
and write the code yourselves to be able to build an application

778
00:38:43.777 --> 00:38:44.258
inside of it."

779
00:38:45.178 --> 00:38:47.968
But then we said, what if we could take that to that next level?

780
00:38:48.698 --> 00:38:52.198
What if we could give you the ability to use Codex,

781
00:38:53.438 --> 00:38:55.518
a coding agent from OpenAI,

782
00:38:56.718 --> 00:38:59.858
so that you no longer have to think about, how do I write this code?

783
00:38:59.938 --> 00:39:01.218
How do I put all of these pieces together?

784
00:39:01.278 --> 00:39:04.808
But instead, you just prompt your way into

785
00:39:04.838 --> 00:39:08.418
building a custom first-party application inside of Cloud Control,

786
00:39:09.278 --> 00:39:10.778
and we said, "Let's go do that."

787
00:39:12.018 --> 00:39:14.878
And that is what is the App Builder that you're seeing over there.

788
00:39:15.758 --> 00:39:17.818
Now, with the combination of Agent Builder

789
00:39:18.998 --> 00:39:20.468
and the combination of App Builder,

790
00:39:21.438 --> 00:39:25.238
you now have an extremely potent combination of

791
00:39:25.298 --> 00:39:29.258
customizing Cloud Control the way you want to use it.

792
00:39:30.778 --> 00:39:30.888
Now,

793
00:39:31.998 --> 00:39:33.198
again, I'm going to take a step back.

794
00:39:35.398 --> 00:39:36.038
We've shown you

795
00:39:37.918 --> 00:39:40.018
a number of different things that we're able to do this.

796
00:39:40.418 --> 00:39:44.358
It's really important to understand that while

797
00:39:44.398 --> 00:39:48.178
we are unifying your management over a single platform, we start

798
00:39:48.218 --> 00:39:51.938
helping you troubleshoot, or we are systematically helping you

799
00:39:51.958 --> 00:39:54.018
secure and automate your network.

800
00:39:55.198 --> 00:39:58.858
You heard Richard show you exactly how you could go about doing that.

801
00:39:59.028 --> 00:39:59.498
And by the way,

802

00:40:00.458 --> 00:40:03.678
what Richard showed you is incredibly important from another perspective.

803
00:40:05.878 --> 00:40:06.898
Securing your network

804
00:40:07.818 --> 00:40:11.458
has never been more important than it has been right now.

805
00:40:12.298 --> 00:40:14.898
If you are tracking what's happening with Mythos

806
00:40:16.478 --> 00:40:18.518
and the Glasswing project that Cisco is part of,

807
00:40:19.738 --> 00:40:22.858
we've learned that there are models right now that are

808
00:40:22.918 --> 00:40:26.308
capable of detecting or creating vulnerabilities,

809
00:40:27.898 --> 00:40:30.938
zero-days, that can compromise your entire environment.

810
00:40:32.738 --> 00:40:36.698
So what we're able to do over here is to show you that, hey, if you

811
00:40:36.798 --> 00:40:38.668
see a known vulnerability,

812
00:40:39.898 --> 00:40:43.488
the time it takes for you to be able to remediate is now dramatically lower when

813
00:40:43.518 --> 00:40:45.618
you start using tools that are agent native.

814
00:40:46.818 --> 00:40:49.038
Because you're not going to be able to stop the vulnerabilities.

815
00:40:49.078 --> 00:40:51.938

What you can do is to react at agent speed,

816
00:40:52.838 --> 00:40:56.478
and that's what we showed you with the third

817
00:40:56.538 --> 00:40:58.658
experience, which is securing and automating your network.

818
00:40:59.438 --> 00:41:02.478
We also showed you how you can easily integrate with third-party products.

819
00:41:03.098 --> 00:41:06.958
And last but not the least, we showed you how we can seamlessly

820
00:41:07.018 --> 00:41:08.978
manage your entire infrastructure.

821
00:41:10.078 --> 00:41:10.218
Now,

822
00:41:11.018 --> 00:41:14.958
when we turned on the ability to be able to build your own custom agents and apps,

823
00:41:17.238 --> 00:41:19.498
something really amazing happened.

824
00:41:19.538 --> 00:41:23.078
We started noticing both our teams and our partner teams starting to

825
00:41:23.098 --> 00:41:26.998
build really cool stuff, and I want to give you a quick snapshot

826
00:41:27.038 --> 00:41:29.438
of what that looks like. So if you don't mind, please roll video.

827
00:42:34.498 --> 00:42:34.818
Folks,

828
00:42:36.108 --> 00:42:37.038

how cool was that?

829
00:42:41.498 --> 00:42:45.178
The number of things that people have been doing with Cloud Control and Canvas has

830
00:42:45.218 --> 00:42:48.958
been absolutely unbelievable. The things that they have been able to build with the

831
00:42:48.978 --> 00:42:52.778
help of Codex, the help of the App Builder and the Agent Builder,

832
00:42:53.758 --> 00:42:56.058
I am super excited

833
00:42:57.258 --> 00:42:59.318
to see what you all go out and build.

834
00:42:59.678 --> 00:43:03.118
Thank you so much for coming here, and I hope you have a wonderful rest of Cisco

835
00:43:03.178 --> 00:43:03.758
Live. Thank you.
