# Cisco Cloud Control — Partner Summit Messaging Guide

**What this is:** An internal messaging guide for Cisco speakers and for the teams working the showcase and demo areas. It is reference material to prepare from, not a script to be read.

**Audience:** Mixed partner executive audience — C-level, practice and business owners, sales leadership

**Purpose:** What's in it for partners — and what we're asking them to do about it

**Status:** Post CA. U.S. general availability, August 25, 2026

**Messaging authority:** GTM Messaging - Cloud Control with AI Canvas (Cisco Cloud Control Messaging Guide, September 2026 — pending final approval)

**Partner economics:** The Partner Opportunity with Cisco Cloud Control - PSOAI-1825 (Cisco Live 2026 Las Vegas)

**Partner Value Proposition and GA Announcement:** Partner Value — Cisco Cloud Control and the U.S. general availability announcement (Cisco Blogs, August 25, 2026)

**How to use this document.** Blockquotes are the argument written out in full — lift the language, then say it in your own words. Everything else is direction for the speaker. Start with the **Executive Brief**, which is the distributable one-page summary and the Hot Topics submission; **Partner value on a page** is the speaker's version of the same argument. Whatever you cut, keep Beat 3 and Beat 8.

## Executive Brief — Cisco Cloud Control

### The Strategic Context: The Operating Model is Changing

Customers' work is growing faster than the teams they can staff for it, and product-by-product management no longer scales. Cisco Cloud Control introduces a unified, AI-native operating model — AgenticOps — where people and AI agents work across product boundaries under clear human accountability. It aggregates the controllers customers already run rather than replacing them.

**Where we are:** GA in the United States since August 25, 2026 — more than 300 customers in production, and a global waitlist that passed 5,000 before launch. This is a deployment conversation, not a launch announcement.

### Value to the Customer: Unified, AI-Native Operations at Scale

- **Structural Advantage:** Alerts aggregated and correlated, cross-domain visibility, and AI-assisted investigation across Networking, Collaboration, Compute, Security, Observability, and Services — while each product keeps its specialized controls.
- **Rapid Resolution:** AI Canvas puts specialists and AI agents in one multiplayer workspace. In a live session, a global supply chain software company resolved in under ten minutes what had taken over ten hours.
- **No New License, No New Cost:** Included in the Essential and Advantage tiers of eligible Cisco subscriptions, so customers start without a separate budget cycle or business case.
- **The CIO Hook:** "How quickly can you move from alert to resolution across your entire Cisco estate?"

Cisco Confidential

## Value to the Partner: From Resale to Co-Creation and High-Margin Services

- **Elevate the Conversation:** "Why is this application slow" gets answered once across networking, security, and observability — a question that today costs three teams a morning. That gets you in earlier, with a broader buyer group.
- **Recurring Revenue:** Every connected product makes the platform worth more and gives you a reason to expand the footprint. One identity and connection model also cuts your cost to serve.
- **Operational Leverage:** Operating-model advisory, managed agentic operations, workflow design and workflow packs on Cisco Workflows, cross-domain expansion, and competitor platform migration — priced against the six-stage adoption lifecycle for billable milestones.
- **Where the Margin Sits:** Cloud Control does not transact, so there is no platform margin. Revenue comes from portfolio expansion, services, IP, and managed operations; incentives land on the products that close alongside it.
- **The Partner Hook:** "Do you want to sell isolated products, or become indispensable by delivering packaged operational outcomes and IP?"

## What is Available Today (Day 1 Readiness)

- **Cloud Control, AI Canvas, and Cisco Workflows are GA** in the U.S., as SaaS from U.S.-hosted infrastructure. On-premises, sovereign cloud, and air-gapped are not supported.
- **Connected at GA:** Meraki, Catalyst Center, Catalyst SD-WAN, Nexus Dashboard and Hyperfabric, Intersight, Identity, Security Cloud Control, ThousandEyes, Splunk, Collaboration Control Hub, and Cisco IQ.
- **Third-party ecosystem:** 60-plus integration commitments; ServiceNow, BlueCat, Infoblox, and Atlassian are already built.
- **Not yet:** Cloud Control Studio is in Beta, and Marketplace partner terms are unannounced. Workflow design and workflow packs on Cisco Workflows are sellable today.
- **Onboarding is Cisco-led today.** Cisco performs customer onboarding; partner-led onboarding is not supported. The two motions to drive now are enabling your teams and making your own production IT estate customer zero, with dCloud for hands-on training and demos.

## Momentum

- Ecosystem growth against the 60-plus third-party integration commitments.
- Geographic expansion to EMEA and APJC as data sovereignty work completes.
- All Cisco product development is consolidated under a single leader, with Cloud Control as the top architectural priority.

## How Cisco Is Enabling Partners

- Role-based enablement for sales, architects, and services teams — SalesConnect for assets, dCloud for labs and demos.
- A six-stage adoption lifecycle to price and package services against measurable milestones, plus partner economics guidance.
- Direct co-development: early partner use cases and feedback influence what ships next.

Cisco Confidential

## Partner Call to Action: Start the Journey

To lead the market, we ask our top partners to take these four steps:

1. **Enable your teams** on Cloud Control, AI Canvas, and Studio as one story — SalesConnect for assets, dCloud for hands-on.
2. **Be customer zero** on your own production IT estate, so teams learn the platform by operating it at real scale.
3. **Qualify accounts and bring them to Sales** for onboarding readiness — Cisco performs the onboarding — and identify the next Cisco product area to connect.
4. **Bring us a use case to co-develop,** and pick the one runbook per account you would turn into an agent first.

We are live in the U.S. and building this with you. The partners who move first won't just sell this platform; they'll help shape it.

## Partner value on a page

**Start here.** This is the executive summary, ordered around the partner business. Use it for a five-minute hallway or showcase conversation.

> "Cloud Control changes what you sell, not just what you resell.
>
> It is included with eligible Cisco subscriptions — no new license, no new cost — so there is no margin on the platform itself. Removing a separate purchase lowers the barrier to adoption. Partner revenue comes from portfolio expansion, services, IP, and managed operations."

| Revenue play | What it means for your business |
|---|---|
| **Lead the unified operations conversation** | Tool sprawl and manual coordination create a business-level problem, bringing you into the account earlier and with a broader buyer group. |
| **Drive pull-through across the Cisco portfolio** | Every product a customer connects makes the platform worth more to them — and gives you a reason to expand the footprint. One connection model across domains also takes cost out of your side of the deal. |
| **Build services around agentic operations** | Professional services and workflow packs today; custom apps, agents, and agent skills built from customer runbooks as Studio access expands. |
| **Extend value through the Marketplace** | Intended distribution route for partner IP. Partner access and commercial terms have not been announced. |

**The market is already moving this way.** Cisco's 2026 Global AI Partner Study surveyed 1,702 partners across 30 countries. Consulting and advisory services jumped from 12% to 50% as a leading growth opportunity — the largest increase of any category in the study. At the same time 92% of partners say customers have raised

Cisco Confidential

concerns about AI running costs, and only 43% say customer ROI is meeting or exceeding expectations. Customers increasingly need operating advice alongside infrastructure. These services address that need.

**Where to start.** Cloud Control is a long-term platform play. Partner onboarding of customers is not supported today, so the two motions to drive now are enablement and customer zero: enable your teams on SalesConnect and dCloud, and onboard your own production IT estate so they learn the platform by operating it at real scale. Then qualify customer accounts and bring them to Sales for onboarding readiness, which Cisco performs. The services engagement builds as those customers move through adoption.

## Beat 1 — Open on the operating-capacity question

Open cold. No agenda slide, no product introduction. Name the pressure your partners' customers live with, so the room knows you understand the business they have been running.

> "Your customers' work is growing faster than the teams they can staff for it. So how do they get more operating capacity without more headcount?
>
> Every one of you has answered that question. You've built the integrations, written the runbooks, staffed the bridge calls, and absorbed the operational cost of Cisco's own fragmentation. You made it work.
>
> Since August 25, that question has a different answer. Cisco Cloud Control is generally available in the United States. More than 300 customers are onboarded and in production. The global waitlist passed 5,000 sign-ups before we shipped.
>
> **So this is a deployment conversation now.** And that changes what your teams need to be ready for."

**Why this matters:** it starts with the customer's operating-capacity problem and recognizes the work partners already do to manage fragmentation.

## Beat 2 — Reframe: this is a change in the operating model, not a product launch

Partner executives invest behind a durable operating-model change, not an individual feature.

> "I want to be precise about what shipped, because if you hear this as 'Cisco released another management console,' you will underinvest.
>
> The operating model for running IT has been rebuilt for the AI era, and Cisco calls it AgenticOps — people and AI agents working together across product boundaries, with clear human accountability for what those agents do. Cloud Control is the operational harness that puts it into practice: it gives agents trusted access to infrastructure, live operational context, and explicit guardrails for action.
>
> Seven layers make that real. AgenticOps is the operating model across all of them."

Name the layer model, then keep it brisk — name the layer, say what it does, move on. On stage, focus on **Platform Services**, **AI Canvas**, and **Cloud Control Studio**; leave the full table in the annex for the technical track.

| Layer | Role |
|---|---|
| **Cisco product experiences** | Retain the specialized tools and controls for each IT domain. Simple without losing the sophistication of the domain controllers. |

Cisco Confidential

| | |
|---|---|
| **Platform Services** | Foundational apps that deliver cross-domain services across the environment — Identity, Inventory, and Topology; Cisco Workflows, Licensing, and Policy. Cisco Workflows is an AI-powered network automation capability that turns repetitive actions into deterministic outcomes. |
| **Actions** | Aggregates, correlates, and prioritizes alerts with affected assets and ownership. Issues can escalate into AI Assistant or AI Canvas. |
| **AI Assistant** | Supports focused investigation and action with an individual operator anywhere in Cloud Control. |
| **AI Canvas** | Gives specialists and AI agents a multiplayer workspace for complex resolution. |
| **Cloud Control Studio** | Builds custom operational apps and ambient agents from natural-language descriptions. |
| **Cloud Control Marketplace** | Opens Cloud Control to apps, agents, and integrations from Cisco and third parties, and brings third-party context into investigations. |

**Terminology:** IT domains are functional areas such as Networking and Security. Meraki, Intersight, and Nexus Dashboard are Cisco products that contribute to those domains. Cloud Control unifies operations across products and IT domains — it does not replace specialized product controls.

**If someone pushes back — "does this replace the domain controllers I've built a practice on?"** Answer it immediately and plainly. Cloud Control does not flatten product depth. The product experiences still own specialized management and execution. Cloud Control connects the work between them. Every hour of Meraki, Intersight, or Nexus expertise your teams hold is still billable — it now plugs into a larger conversation.

## Beat 3 — What's in it for partners: four ways to make money on this

Spend most of the time here. State the headline first, then cover the four revenue plays.

> "So — what's in it for you.
> The headline is that Cloud Control changes what you sell, not just what you resell. It gives you a platform-led motion: helping customers move from fragmented, product-by-product operations to a unified, AI-native operating model across Networking, Collaboration, Compute, Security, Observability, and Services.
> There are four ways to make money on that, and they stack."

### One — lead the unified operations conversation

> "Cloud Control is a strategic entry point into accounts where the customer is losing time to tool sprawl, operational silos, and manual coordination. What makes it a boardroom conversation is what unification makes possible: a question like 'why is this application slow' gets answered once, across networking, security, and observability together. Today that same question costs three teams a morning of

Cisco Confidential

> reconstructing context. Cross-domain issues stop being coordination projects — and that gets you in front of a different buyer, earlier, with a bigger problem to solve."

## Two — drive pull-through across the entire Cisco portfolio

> "Because Cloud Control is included with eligible Cisco subscriptions, you can use it to show customers what the broader Cisco estate is actually worth when it works together. Every product a customer connects makes the platform more valuable to them — and gives you a reason to expand the footprint.
>
> It also takes cost out of your side of the deal. Bringing a customer onto several Cisco domains runs through one identity and connection model instead of a separate onboarding project per product. A multi-domain deal gets easier for you to land and cheaper for you to support, which is the difference between a bigger deal and a better one.
>
> Use it three ways: expand in accounts where Cisco owns only one or two product areas; displace competitors in accounts where fragmentation *is* the pain point; and accelerate multi-product deals by showing unified value from day one.
>
> At GA, Cloud Control connects Meraki, Catalyst Center through Meraki Global Overview, Catalyst SD-WAN, Nexus Dashboard, Nexus Hyperfabric, Intersight, Identity, Security Cloud Control, ThousandEyes, Splunk, Collaboration Control Hub, and Cisco IQ and services. And it goes beyond Cisco. The third-party ecosystem is backed by more than 60 integration commitments, spanning the categories customers already run: ITSM, DNS/DHCP/IPAM, network monitoring, identity and device management, collaboration, AI and cloud infrastructure, and infrastructure knowledge. The first of those — ServiceNow, BlueCat, Infoblox, and Atlassian — are already built."

**Programs and incentives.** Cloud Control itself does not transact, so there is no incentive on the platform. Incentive value lands on the products, subscriptions, and renewals that close alongside it, under existing programs. *Specific program names and rates are TBC with partner programs and should not be quoted until confirmed.*

## Three — build services around agentic operations

> "Partner margin begins with the operating model: AgenticOps advisory, managed agentic operations, workflow design and workflow packs, integration design, and cross-domain expansion. Studio creates an additional opportunity for custom apps and agents, but it remains in Beta.
>
> **AI Canvas** is the multiplayer workspace inside Cloud Control — specialists and AI agents investigating a cross-domain issue together, in parallel, in one place. For you it is where you sell resolution outcomes: troubleshooting that cuts MTTR, with context that survives shifts and handoffs.
>
> **Cloud Control Studio** is designed for custom apps, ambient agents, and agent skills built from customer runbooks and organizational knowledge. It is in Beta. Cisco Workflows is generally available, so workflow design and workflow packs are services you can deliver today.
>
> Your services attach around the operating model, workflow and integration design, and managed operations — followed by custom agent development as Studio access expands. These are partner-built and partner-run services on top of the platform.

Cisco Confidential

> A practical Studio opportunity is converting customer runbooks and specialist knowledge into reusable agent skills. Partners can begin by identifying the accounts and runbooks with the clearest operational value.
>
> The four things you actually build — domain agents, workflow packs, integration apps, and design services — are in Annex A2 if you want the taxonomy after the session."

### Four — extend value through the Cisco Cloud Control Marketplace

> "The Marketplace is intended to help customers discover and manage apps, agents, integrations, and skills — and to provide a distribution route for partner IP. Cisco has not announced partner access or commercial terms."

Then give them the customer-facing language for each footprint, so they can leave the room and use it:

| Customer situation | The line to use |
|---|---|
| **One Cisco product area** | "Get value from the product area you already run — and add cross-domain context as you expand." AI Canvas delivers intelligent troubleshooting within the connected product area. |
| **Two or more Cisco product areas** | "Get more value from what you already own." Unified operations across the existing footprint spanning IT domains. No new license, no new cost. |
| **Net-new IT leadership** | "A unified, governed path to agentic IT." One platform for management, visibility, and governance, with a practical on-ramp to AI-driven operations. |
| **Operators** | "From alert to resolution, faster." Alerts arrive with answers. Agents investigate alongside the team. Context survives shifts and handoffs. |

Land the beat with the reframe:

> "That is the shift from resale to co-creation. You help customers consume Cisco innovation faster, integrate the connected third-party systems they already run, and eventually package your own expertise as repeatable, scalable offerings."

## Beat 4 — Handle the money question before they ask it

Address the commercial model early. Cloud Control has no separate price, so explain where partner revenue attaches.

> "Cloud Control is included in the Essential and Advantage tiers of eligible Cisco subscriptions. There is no separate Cloud Control transaction or platform margin.
>
> Removing a separate purchase lowers the barrier to adoption. Partner revenue attaches to portfolio expansion, services, IP, and managed operations.

Cisco Confidential

> Customers can begin without a separate budget cycle or business case for Cloud Control. Connecting products still has technical prerequisites, creating a paid readiness and implementation opportunity for partners."

Then give them the packaging model, because "sell services" is not a plan until it maps to billable stages:

> "You can build and price an engagement against the customer's progress through the Cloud Control adoption lifecycle: Onboard, Implement, Use, Engage, Adopt, Optimize. Each stage is defined by measurable customer activity — logins, tenants linked, features used, AI Assistant and AI Canvas queries, workflows executed. That creates a measurable services structure with clear billable milestones."

Three horizons, said out loud. Only the first one is sellable today:

| Horizon | What you sell |
|---|---|
| **Today** | Operating-model and AgenticOps advisory, managed agentic operations, workflow design and workflow packs on Cisco Workflows, integration design, cross-domain expansion, competitor platform migration, adoption acceleration |
| **Next** | Custom apps, agents, and agent skills as Cloud Control Studio opens to partners |
| **Marketplace** | Intended distribution route for partner apps, agents, workflows, integrations, and reusable IP. Partner access, monetization, certification, and listing models have not been announced |

> "So: recurring, high-margin services revenue today, and a path to scalable, platform-based IP through the Marketplace."

## Beat 5 — The conversation no competitor can have

Keep this short. Explain Cisco's differentiation without turning it into a feature comparison.

> "For the first time, you can demonstrate the full Cisco portfolio working as one system — Networking, Collaboration, Compute, Security, Observability, and Services.
>
> **Specialized depth in every IT domain.** Each product retains the capabilities and controls its operators depend on.
>
> **Cross-domain visibility across Cisco and third parties.** First-party and third-party context in one operational picture for operators and agents.
>
> **A governed path to AgenticOps.** The operational harness gives agents defined access and authority under human oversight.
>
> **Open by design.** Integrations connect the systems customers already run, and the Marketplace is built to extend that to apps and agents from Cisco and third parties.
>
> **Capabilities built for the organization.** In Cloud Control Studio, you build custom apps and ambient agents; agent skills draw from runbooks and specialist knowledge.

Cisco Confidential

> No competing platform can offer that combination across Networking, Collaboration, Compute, Security, Observability, and Services in one governed, agentic operating environment. This gives partners an opening to lead the cross-domain operations conversation."

## Beat 6 — Proof

An executive audience discounts capability claims and remembers customer outcomes. Choose two or three. Prefer NTT DATA for a partner-heavy room and AMD when a named customer matters.

> "This is already working in production.
>
> **From more than ten hours to under ten minutes.** In a live session, a global supply chain and commerce software company used AI Canvas to resolve a recurring site issue in under ten minutes. Their previous manual investigations took over ten hours.
>
> **A direct answer with no custom code.** At a leading investment management firm, a ThousandEyes specialist answered a question with a single AI Canvas prompt — a question that had previously required a custom Python workaround.
>
> **Problems found before users complain.** At a higher education technology provider, a network engineer now logs into Cloud Control daily and tells us it is already surfacing real issues before users can report them.
>
> **NTT DATA, on the platform.** Dilip Kumar, President and Global Head of Technology Solutions: *Our joint integration of Cisco AI Canvas and Cloud Control demonstrates the power of platform-level orchestration across multi-domain environments. The flexibility and API-driven architecture enabled seamless integration into our AI-native SDI Services model, accelerating operational efficiency and scalability. This reinforces the strength of our partnership and sets a strong foundation for next-generation, outcome-driven services.*
>
> **AMD, on the customer side.** Hasmukh Ranjan, CIO and SVP: *AMD uses Cisco technology, including Cloud Control and Defense Claw, to streamline operations and focus resources on managing AI infrastructure. AMD IT, in strong partnership with Cisco, is addressing key areas including tokenomics, AI compute, and infrastructure innovation. This is the best time to be in IT, as hardware operators are back and infrastructure is at the center of every enterprise's AI journey.*"

If the room includes technically skeptical leadership, add the model strategy — it is the answer to "is this just a chatbot on top of my network?":

> "And on accuracy: Cloud Control routes each task to the right intelligence. Cisco domain models where infrastructure-specific expertise matters — the Cisco Deep Network Model for networking, the Deep Time Series model for telemetry and trend analysis. Cisco task-specific models like Antares for narrow, high-volume work. Frontier models — GPT, Claude, and others — for broad reasoning and general questions. Nobody else can bring a purpose-built network model to this problem, because nobody else has four decades of network data to train it on. Accuracy improves without sacrificing speed."

## Beat 7 — Set expectations clearly

Give partners an accurate account of availability, access, and regional limits.

> "Here is the current availability and access model.

Cisco Confidential

> **GA is the United States, delivered as SaaS from U.S.-hosted infrastructure.** EMEA and APJC follow as data sovereignty work completes. On-premises, sovereign cloud, and air-gapped environments are not currently supported.
>
> **Partner onboarding of customers is not supported today.** Cisco runs customer onboarding itself. Sales qualifies and prepares the customer, and Cisco confirms the dates. Your role is to qualify the account and lead the readiness conversation — not to perform the onboarding.
>
> **So there are two motions to drive right now: get your teams enabled, and make your own production IT estate customer zero.** Everything else follows from those.
>
> **Be customer zero on your own production IT estate.** That gives teams the device count, live traffic, and cross-domain activity needed to experience the platform at real scale. Solution labs and center-of-excellence environments do not provide enough operational activity to demonstrate that value.
>
> **For hands-on training and demos, use dCloud.** Use your own production estate to experience the platform under real operating conditions. Training and customer-ready assets are on SalesConnect.
>
> **Cloud Control Studio is in Beta.** Partners can identify candidate accounts and runbooks, but Studio-based engagements cannot yet be committed. Marketplace partner access and commercial terms remain unannounced. Cisco Workflows is generally available, so workflow design and workflow packs can be sold today.
>
> **Confirm before you demo.** Verify the connected products, integrations, subscriptions, permissions, configuration, and region for the account.
>
> **Base usage and base rate limits are included today,** and Cisco reserves the right to adjust monetization, pricing, and packaging as usage scales."

## Beat 8 — The ask

Close with five specific partner actions.

> "Here is what I'm asking you to do.
>
> **One — enable your teams on the unified narrative** — Cloud Control, AI Canvas, and Cloud Control Studio as one story. SalesConnect for the assets, dCloud for the hands-on. This is the one you can start tomorrow.
>
> **Two — be customer zero on your own production IT estate.** Operate the platform on your own network, at your own scale. That is how your teams learn it, and it is what makes them credible in front of a customer. With partner onboarding of customers not yet supported, this and the first ask are the two motions you can actually drive today.
>
> **Three — qualify accounts and bring them to Sales for onboarding readiness.** You qualify and lead readiness; Cisco performs the onboarding. Access is guided and capacity is finite. The waitlist is 5,000 deep. Where your accounts sit in that line is largely up to how fast you move.
>
> **Four — expand the connected Cisco footprint.** Identify the next relevant Cisco product area in each account and show the cross-domain value it adds.
>
> **Five — bring us a use case.** Engage the Cisco team to co-develop vertical or customer-specific use cases. Pick the one runbook per account you would turn into an agent first, so you are ready when Studio opens. And if you operate outside the U.S., start preparing your teams now for when your geography opens."

Close on the one-line message. Say it slowly, then stop.

Cisco Confidential

> "Cisco Cloud Control is live in the U.S., and partners have a direct role in how it develops.
> Early partner use cases and feedback will influence what comes next."

## Soundbites for the hallway and the press gaggle

- *"AgenticOps is the operating model. Cloud Control is the operational harness that makes it safe."*
- *"Cloud Control has no separate platform margin. Partner revenue comes from portfolio expansion, services, IP, and managed operations."*
- *"Ten hours to ten minutes. Real customer, live session."*
- *"We connect the work between products without dumbing any of them down."*
- *"Customer runbooks are the starting point for reusable agent skills."*
- *"300 customers in. 5,000 waiting. Where are your accounts in that line?"*
- *"This is the shift from resale to co-creation."*

## Anticipated executive questions

**Rehearse these.** In a mixed partner executive audience, the first three are near-certain.

**"If it's included at no cost, where is my revenue?"**

Partner revenue attaches to services and IP around the platform. Today that includes operating-model and AgenticOps advisory, managed agentic operations, workflow design and workflow packs on Cisco Workflows, integration design, cross-domain expansion, and competitor migration. Custom agent development follows as Studio access expands. Price the engagement against the six-stage adoption lifecycle to create measurable, billable milestones. Existing incentives continue to apply to the products, subscriptions, and renewals that Cloud Control helps pull through. (Specific program names and rates remain TBC.)

**"Which tier do I need?"**

Cloud Control is included in the Essential and Advantage tiers of eligible Cisco subscriptions. Entitlement follows the subscription the customer already holds for each connected product. Confirm the account's specific footprint with offer management before providing a use-case-by-tier comparison.

**"Does this cannibalize the managed services I run on domain controllers today?"**

No. Product experiences keep specialized management and execution. Cloud Control connects the work between them. It raises the ceiling on what you can manage and takes cost out of the coordination your teams currently absorb for free.

**"Cisco has promised unified management before. Why is this different?"**

Start with the architecture, because that is the part that did not hold last time: Cloud Control aggregates the controllers you already run up into a management plane, rather than trying to rebuild every controller underneath it. Nothing has to be replaced for this to work. Then the structural reasons: all product development is consolidated under a single leader for the first time in Cisco's history; the President and Chief Product Officer is driving it personally as the top architectural priority; and it is generally available with 300-plus customers in production, not on a slide.

**"What if my customers aren't in the U.S.?"**

Cisco Confidential

Cloud Control is U.S.-hosted and delivered as SaaS at GA. EMEA and APJC follow as data sovereignty work completes. Use the time — train your teams on dCloud now so you are ready on day one in your geography instead of starting from zero.

**"What about my customers with on-premises or air-gapped requirements?"**

On-premises, sovereign-cloud, and air-gapped deployments are not currently supported. Position Cloud Control for U.S.-hosted SaaS environments and keep the existing customer motion for other deployment models.

**"Can I really build IP on this, or am I building free features for Cisco?"**

Cloud Control Studio is designed for custom apps, ambient agents, and agent skills built on customer operational context and organizational knowledge. That work remains partner IP. Studio is in Beta. Partners can identify candidate accounts and runbooks now, and can already build workflow packs on Cisco Workflows. Marketplace partner access and its monetization, certification, and listing models have not been announced.

**"When can I get Studio access?"**

Studio is in Beta. Cisco has not announced general partner access or licensing. Capture the partner, account, and proposed use case for consideration; use dCloud for hands-on Cloud Control in the meantime.

**"Can I onboard my own customers?"**

Not today. Cisco performs customer onboarding, and partner-led onboarding is not supported. You qualify the account, lead the readiness conversation, and Cisco confirms the date. The two motions you can drive now are enabling your teams and running Cloud Control on your own production IT estate as customer zero — which is what makes your teams credible in front of a customer. Point the services conversation at AgenticOps advisory, managed operations, workflow design, and cross-domain expansion.

**"Can I get Cloud Control in my lab or my center of excellence?"**

A lab typically lacks the devices and live traffic needed for cross-domain correlation, so it cannot demonstrate the platform's operational value. Use dCloud for training and demos; use your own production IT estate to experience Cloud Control under real operating conditions.

**"How many tenants can a customer link?"**

Cloud Control supports one-to-many tenants and orgs linked to a single tenant group for Meraki, Intersight, Nexus Dashboard, Collaboration Control Hub, Nexus Hyperfabric, and Catalyst Center through Meraki Global Overview. For the remaining connected products, the customer chooses which tenant or org links to the main tenant group and which they navigate to individually. That is **multiple product tenants for that one customer** — their own Meraki, Intersight, Nexus, and so on, under one tenant group. It is not hierarchical multi-tenancy for a partner or a multi-customer MSP portal. The MSP service motion is a separate, forward-looking conversation (Annex A3).

Cisco Confidential

## Partner Economics Annex

Speaker backup, not stage material and not a handout. The eight beats stay the spoken track. Use this annex to answer questions from the floor, in hallway conversations, or in a follow-up if someone asks for the numbers. **Do not read A1 from the stage** — if a market figure is said out loud it will be quoted back, and the caveat will not travel with it.

### A1 — Market context

Backup for questions. Market values are public third-party estimates; the Cloud Control opportunity is inferred from adjacent markets. Forecast periods differ; see A5.

**Use the partner study first.** Unlike the market table below, Cisco's 2026 Global AI Partner Study is first-party, public, partner-specific, and safe to quote from the stage — 1,702 partners across 30 countries, published September 2026. Consulting and advisory services jumped from 12% to 50% as a leading growth opportunity, the largest increase of any category. 92% of partners report customers raising concerns about AI running costs, while only 43% say customer ROI is meeting or exceeding expectations. Nearly half of customers are piloting or scaling agentic AI, and multi-agent orchestration ranked as the weakest capability measured across customer readiness, partner capability, knowledge, and hands-on experience. Roughly a quarter of partners say AI already makes up more than half their revenue, and 55% expect to be there within five years.

| Market | Cloud Control mapping | 2025 | 2030 | CAGR |
|---|---|---|---|---|
| **Enterprise agentic AI** | Agent marketplace — domain agents for troubleshooting, config validation, remediation, lifecycle actions, compliance checks | $3.67B | $24.50B | 46.2% |
| **AI orchestration** | Workflow / orchestration packs — prebuilt runbooks across networking, security, observability, ITSM, MSP operations | $11.02B | $30.23B | 22.3% |
| **Cloud professional services** | Design and architecture — normalized API strategy, operating model, workflow design, governance, MSP tenant design | $35.04B | $75.80B | 16.7% |
| **ITSM** | ITSM / AIOps integrations | $15.30B | $29.93B | 14.4% |

Cisco Confidential

| | | | | |
|---|---|---|---|---|
| **Network automation** | Cross-domain automation | $7.88B | $12.38B | 9.4% |

The blended partner opportunity spans large, durable markets like MSP and ITSM plus fast-growing markets like AI orchestration and agentic AI. The five-year view is a portfolio of growth curves, 9–46% CAGR.

## A2 — What partners build

The four revenue plays in Beat 3 are go-to-market motions. These are the four things partners build. The most attractive partner motion is packaged operational outcomes delivered as apps, agents, integrations, and workflow packs.

**This table describes the target state.** Workflow packs, integration apps, and design services are sellable now — Cisco Workflows is generally available. Domain agents depend on Cloud Control Studio, which is in Beta; Marketplace partner access and commercial terms have not been announced. See Beat 7.

| What you build | Adjacent market | Concrete examples |
|---|---|---|
| **Domain agents** | Enterprise agentic AI | Troubleshooting, config validation, remediation, lifecycle actions, compliance checks |
| **Workflow / orchestration packs** | AI orchestration, ITSM, workflow automation | Prebuilt runbooks across networking, security, observability, ITSM, MSP operations |
| **Integration apps** | API management, ITSM, AIOps | Connectors into Splunk ITSI, ServiceNow, Jira, PagerDuty, CMDBs, SIEM/SOAR, partner NOC tools |
| **Design / architecture services** | Cloud professional services | Normalized API strategy, operating model, workflow design, governance, MSP tenant design |

## A3 — What MSP partners can package and sell

The GA Ideal Partner Profile includes **single-tenant MSPs**. Cloud Control aligns with recurring managed operations for that profile: delegated tenancy, co-managed NOC/SOC, managed automation, compliance, lifecycle assurance, and vertical service packs.

**These are services a partner packages and sells around Cloud Control — not Cloud Control features.** Like the ISV motion in A4, treat this as forward-looking. The GA tenant capability is multiple product tenants for a single customer (see the tenant Q&A), not partner multi-tenancy.

| Partner service | What you sell |
|---|---|
| **Managed operations** | Controller consolidation, operational workflows |

Cisco Confidential

| | |
|---|---|
| **Co-managed NOC/SOC** | Shared customer / MSP operations |
| **Managed automation** | Repeatable remediation, compliance checks, policy workflows |
| **Vertical service packs** | Compliance for healthcare, retail, manufacturing, SLED, financial services |
| **Premium assurance** | SLA reports, incident prevention, lifecycle risk, Cisco IQ / Cloud Control insights |

## A4 — ISV motion, adjacent to the Ideal Partner Profile

ISVs are not in the GA Ideal Partner Profile. The profile remains U.S.-based Cisco Preferred Partners (PVI 7.5+) — VARs, SIs, GSIs, and single-tenant MSPs. The ISV motion is a strong current opportunity adjacent to that gate, and it is forward-looking.

**Build:** Cloud Control-aware agents, workflow packs, integrations, and domain apps.

**Sell:** architecture and design services around data models, RBAC, governance, and workflows.

## A5 — Attribution

Market sources: Grand View Research, MarketsandMarkets / PRNewswire, Technavio. Forecast periods differ, and the specific citations sit in the session appendix.

Partner survey figures — the 12% to 50% shift in consulting and advisory services, the 92% running-cost and 43% ROI findings, the agentic adoption and multi-agent orchestration readings, and the AI share-of-revenue numbers — come from Cisco's 2026 Global AI Partner Study, *From Adoption to Accountability: How Partners Can Close AI's Value Gap* (Cisco Blogs, September 21, 2026). That study is Cisco first-party and public, so unlike A1's market table it can be said out loud.

Market values are public third-party estimates; the Cloud Control opportunity is inferred from adjacent markets. Market context (slide 20), the build taxonomy (slide 19), the MSP services table (slides 21 and 31 — adapted; the multi-customer visibility item is deliberately omitted, since the GA tenant capability is multiple product tenants for a single customer, not partner multi-tenancy), the ISV motion (slide 21), and the AMD (slide 22) and NTT DATA (slide 23) quotes all come from The Partner Opportunity with Cisco Cloud Control - PSOAI-1825, Cisco Live 2026 Las Vegas. The portfolio areas — Networking, Collaboration, Compute, Security, Observability, and Services — follow the BDM and TDM decks (slide 3). The GA date, the customer and waitlist figures, the integration commitments, and the three customer proof points are stated publicly in the U.S. general availability announcement (Cisco Blogs, August 25, 2026). The four revenue plays, the two ideal profiles, the commercial model, and the six-stage adoption lifecycle follow the Partner Value Proposition. Messaging follows GTM Messaging - Cloud Control with AI Canvas, the Cisco Cloud Control Messaging Guide, September 2026, pending final approval.
