```

[00:00:01] Speaker1:
Good morning everyone and welcome to our specialist masterclass first look at Cisco cloud control with AI canvas. We're thrilled to have you with us today as we pull back the curtain on a major milestone in our transformation. To kick things off we are honored to have a special message from our SDP of global specialist Dave West.

[00:00:22] Speaker2:
Thanks everyone for joining I have to say it's an honor to kick off this session. You know we're stepping into a new era, the agentic era. We move beyond chatbots that just answer questions to agents that take real action. Our customers face new challenges, infrastructure limits, trust issues, data trapped in silos. And I think we can help solve that. That's what Cisco Cloud Control with AI Canvas is about. It marks a milestone in how we serve our customers. Whether you're in an architecture, Splunk, or in a geo team, You're the front line of this transformation. Challenges don't live in silos and neither can our solutions. We used to be seen as powerful, but powerful in separate parts. Now it's one Cisco bringing things together, delivering platforms and new capabilities. Cisco Cloud Control is a game changer in making that real. Our customers are overwhelmed. fragmented tools, fragmented data, all while trying to build AI-ready foundations. They don't want more point products. They want integrated systems. Cisco Cloud Control with AI Canvas is that system. The connective tissue turning one Cisco from vision to reality. Now we're moving from a reactive networking approach to a unified, agentic operations approach. And every one of you is how we get there. You know, in the past, we've talked about networking, security, AI infrastructure, observability and collaboration, all as separate parts, separate pieces. Now with Cisco Cloud Control, We now have the engine that unites them all. It gives operators a single surface across our portfolio. And AI Canvas puts teams and agents side by side in a shared workspace to investigate, resolve, and act with cross domain context that only Cisco can deliver. Now, whether you're a customer that's buying and building AI ready data centers or future proof workplaces or just trying to

boost digital resilience. This is what makes our portfolio one cohesive system. You all have been asking for this. You've been begging for it quite honestly to help compete and take out the competition. And now we have an opportunity to go big. Now we're still in controlled availability. We're gonna try to go big in the US market. And I have to say a big shout out to the field teams who brought 39 customers into early access. And hopefully we can showcase many of them at Cisco Live. That's your early mover advantage. Take advantage of it. So I want you to cement your role as trusted advisors by helping customers Unify their IT stack. Success isn't about selling a single domain anymore. It's about orchestrating a cohesive AI ready operation. Today you'll see the platform live. You'll hear about the competition and how you should be positioning Cisco Cloud Control with AI Canvas and get the door openers to win in Q4, I believe to really start this journey and build your FY27 pipeline. I ask you all to lean in, listen to the connect training, find the threads between your expertise and customer outcomes. The tech is ready and gets better and better every time one of you engages with it with your customer. Our strategy is aligned and the market is just waiting. They're just waiting for us to deliver. So my ask of all of you is lean in on this training, learn, get context from Sales Connect if you need more, ask the experts, but let's be bold. Let's show the market what Cisco can do. And I know if we do that, we will be incredibly successful. So thank you for all you do and let's enjoy the day.

[00:05:13] Speaker3:
Thank you, Dave.

[00:05:14] Speaker1:
I would now like to introduce DJ Sanpath, our SVP GM of AI software and platform. DJ, over to you. Hey, thanks so much, Sean. And thanks, everybody, for having me here. And super excited to tell you what the team has been working on in the past eight months at this point in time.

[00:05:36] Speaker4:
But more importantly, you heard what Dave just said. This is something that we know is

[00:05:44] Speaker1:
going to make a massive difference when we go out to our customers and start to explain to them

[00:05:51] Speaker4:
what it is that we're trying to accomplish. So let me give you a little bit of context

[00:05:54] Speaker1:
about what it is that we're doing, what it is that we're built, and you're going to see a live demo

[00:06:01] Speaker2:
that you at the end of this call

[00:06:03] Speaker4:

should be able to go out and try out for yourselves and experience exactly what we're about to ship

[00:06:10] Speaker1:
and what our customers today.

[00:06:12] Speaker4:
Dave mentioned 39, I believe we're already at 50 from the time that he mentioned this And that's how quickly we're moving to be able to go out and get these customers lined

[00:06:21] Speaker1:
up for us to be able to work with them, to onboard them and get them all excited about Cisco Cloud Control and Canvas.

[00:06:30] Speaker4:
So let's get into it, right? And you heard Dave talk about this. You said, listen, over the years at Cisco, we have done a phenomenal job of building the best in class capabilities across every single one of these domains, networking, AI infrastructure, observability and collaboration. Each one of these things right now is a pull out of strength for us. Now, when you start to think about what's really happening from an inflection point perspective, you know, is that the world kind of fundamentally changed, right? And so what we have to do is we think about each and every single one of these pillars is for us to start thinking about how do we evolve so that humans and agents can collectively work together. So the question we asked ourselves before we got into this was to say, hey, what does it look like when humans and agents can actually

[00:07:24] Speaker1:
collaboratively start to work together?

[00:07:25] Speaker4:
This is not, you know, agents just running in the background,

[00:07:28] Speaker1:
doing a bunch of different things that you cannot see.

[00:07:30] Speaker4:
It's not just humans constantly just clicking through, you know, dashboards, scrolling through all of these notifications. But truly what would it mean to have a collaborative operating model where the agents are doing a lot of the heavy lifting and humans are staying in control of what matters. Now, we call this framework agentic ops, right? We call this, what we saw from a paradigm shift perspective was the ability to start to use agents

[00:08:05] Speaker1:
to be able to redefine your operating model

[00:08:08] Speaker4:
and we carved the term out called agentic ops and we're starting to see it, you

know, start to pop up in the industry,

[00:08:15] Speaker1:
the rest of the industry is now following us.

[00:08:19] Speaker4:
What we did was we basically took this notion of agentic ops and we made sure that agentic ops lives inside of cloud control. Cisco cloud control is the management experience where all of agentic ops comes to life. Now, when you ask me what Cisco cloud control is, you know, and what agentic ops is, Let me start to define this by giving you three core tenets that is absolutely important and making sure agentic ops become successful. For agents to effectively operate, they need to have access to cross-domain telemetry. That is the number one thing. They need to be able to seamlessly access things

[00:09:02] Speaker1:
from collaboration to observability,

[00:09:08] Speaker4:
to like networking, to like security. So cross-domain telemetry is super important. The second big thing is really all about purpose-built models. And the third is trusted agents

[00:09:19] Speaker3:
that serve as your additional coworkers.

[00:09:22] Speaker4:
And I want to be able to spend time on each and every single one of these things. What do I mean by purpose-built models?

[00:09:29] Speaker4:
Is this sort of where we're training these models with 40 years of data that we have or in what does trusted agents really mean? So let's go into each one of these really quickly so that you have an understanding of what these core pieces mean. Now when we talk about cross-domain telemetry, you'll notice that, you know, when Robert's going to walk you through the demo, you're going to realize that we've broken some of these things down into the product surfaces that you are very familiar with, the platform services that connect these product surfaces in a systematic way, where you start to see pieces that are core to the platform that simplifies how quickly we take these products to market. And then finally, you're going to see us realize these capabilities with the help of agents that cut across all the domains in a seamless fashion. So it's absolutely important to get the cross-domain telemetry right for these agents to be effective. Now the second thing I want to touch upon over here is specifically hopping into what we call purpose-built models. Now the cross-domain telemetry piece is your first building block, but beyond that We're training our own domain specific models. We've got models like deep network model. Now we also know that in addition to deep network model,

[00:10:46] Speaker1:

we also have a foundation set model

[00:10:48] Speaker4:
that is public and available and it's open source. We've got a time series model. But we also know that there are times where the frontier model might be a better option. There are times where task specific model

[00:10:59] Speaker1:
might be a better option.

[00:11:01] Speaker4:
And so you'll notice that based on the incoming task, we have the ability to seamlessly route these tasks to each one of these models so that you get the right type of response from, you know, from whichever model you're picking to be able to go out and do these tasks. But it's really important to have, you know, a purposeful model that we have built based on data that we have that's unique to us, but also leverage models that are task-specific and models that are, you know, the latest and greatest and the frontier models that are out there. Now the other very core ingredient here is when you evolve into you you know from from like just humans interacting to like humans plus agents coming together what is really important at this point in time is to ensure that you are able to trust these models when you give them specific tasks you know you have to you know make sure you're inspecting all of these models you're inspecting these agents from a supply chain perspective you know you're making sure that these are not compromised you have to observe every single action that these agents take and you have to ensure that these agents are doing the right types of things. All of these things become incredibly important for us to be able to get right and that's really a core part of why our agentic ops story is better than anything else that's out there because we can do this. Now, I want you all to meet Cisco Cloud Control when Robert walks you through the demo, you're going to see that this is the place where all of these things happen, right? It is AI native by design. I hope you all appreciate the work that has gone into it from a design perspective. We've gone ahead and said, listen, everybody is familiar with a text box that allows you to chat and that allows you to work with these agents. We've fundamentally reimagined exactly what that experience looks like, and I can't wait to walk you through those details in a second. Now, what we have also done is we have systematically brought together a single sign-on for all of these products so that you're signing in one time,

[00:13:06] Speaker1:
not signing each and every single time into every single one of these products.

[00:13:10] Speaker4:
What we've also done is we have systematically and seamlessly brought together all of your assets in one place. Now this is not just, you know, assets from one part of the products or another, we're bringing all of the assets across all of Cisco's surface area in a single place so

[00:13:27] Speaker1:
so you have one source of truth.

[00:13:30] Speaker4:
We also brought together your topology view, which tells you exactly how these systems are connected and in which geos are they at. And last but not the least, we brought all of these pieces together inside of our AI Canvas, which allows you to go from just visibility into being able to take actions.

[00:13:49] Speaker3:
So you're not just looking and observing things.

[00:13:53] Speaker4:
Now I'll say this though, most customers wanna be able to start with read only before they move into the ability to start taking actions. And so we are prioritizing the ability to increase the confidence that customers have

[00:14:06] Speaker1:
with using what we're shipping to them.

[00:14:09] Speaker4:
Now with AI Canvas, this is one of the coolest things where AI Canvas is natively part of Cisco Cloud Control. And I want you to be extremely clear about this. You know, I know that there are questions come up saying, hey, what is Cloud Control? What is Canvas? How do all of these pieces work together? Guess what? I want to make this super simple. AI Canvas will exist inside of Cisco Cloud Control and will be synonymous in providing some of these

[00:14:38] Speaker1:
agentic ops capabilities that we're talking about.

[00:14:40] Speaker4:
It's the industry's first generative AI workspace and we're adding amazing capabilities to it

[00:14:48] Speaker1:
almost on a weekly, monthly basis, right?

[00:14:51] Speaker4:
We're adding enterprise memory, we're adding deep reasoning mode, we're adding safe and secure operations And I know I've talked to you about this before, but I just want you to make sure that you understand that this is seamlessly baked into Cisco Cloud Control. I'm coming up on time, so I just wanna be, I just wanna hit one point, right? All of these products that you see on the screen are available inside of Cisco Cloud Control. We're talking about, you know, Meraki, when you click into Meraki, you get all of Meraki. You're not getting one part of Meraki. You're not getting like, you know, one window.

[00:15:25] Speaker3:
You're getting all of Meraki.

[00:15:26] Speaker4:
You're getting the full experience. You're not separately logging in here.

You're not switching between portals. It's a unified platform that starts to render each and every single one of these pieces. You get 1,000 ICE. You're going to start to see this in a Splunk Cloud, Secure Access, Hyperfabric, Datanexus, InnerSight, Catalyst, WebEx Control Hub, and IQ is going to start to come seamlessly into this whole context together. And that's really what we're trying to accomplish. Let me just take a few extra minutes and I know I'm going a little bit longer. I want to give you one important perspective of how we have picked our initial customer profile, our ICP, our ideal customer profile for this whole thing. We want it to be very thoughtful around who are the ones that are most likely to be successful. We looked at the entire customer population. We understood the eligible customers. We picked the regions. We picked the primary segment. The ones that are in commercial selected enterprises

[00:16:24] Speaker1:
over public sector and over service providers.

[00:16:27] Speaker4:
And because it is easier for us to be able to go to market with these folks quicker and faster. And we also made sure that we're picking specifically customers that have more than two Cisco products because that's where the power of the platform becomes even more compelling. And as we continue going forward, those customers that have more than two products are likely to be a lot more excited about what we have to offer, right? And then we picked out of that the top 2,500 accounts, We picked the 600 of them where we know that the accounts were present, some of the majority of our bookings. And then we said, okay, let's maniacally focus on this set of customers over here. Because these are going to, these customers are going to experience the fact that we're bringing the platform together and they can then start to recognize that, you know, they start to become mega champions, mega promoters of what we are going out and giving to them. And that's really what we're aiming to accomplish. we want referenceable customers that you can take to the back, each and every single time that you're having conversations with your customers to say, hey, this thing works. It is the best thing since life spread. Now, we are already actively working with a large group of customers, as you all know, and thanks to a lot of you all who have helped nominate these customers and are working very closely with the team to make these successful. And we're working actively to make sure that these customers are experiencing Cisco Cloud Control. Now, I'll be honest with you. We're not perfect. There are things that we have to get better and we're learning constantly from the customers. When they come back and say, hey, you need to make this better. But what you know from our team and the product teams and our field and engineering teams, we will move incredibly fast when we get that so that we can go back to them with the feedback and then make sure that they're having an amazing experience. I do wanna talk about, one of the interesting things that we have been learning

[00:18:14] Speaker1:
is we have gone to customers and we showed them

[00:18:17] Speaker4:
Exactly, you know, what customers feedback has been the most interesting one that we got, you know, we've been closely working with room and board and G2 has

been having conversations with the teams that are implementing this. And we've gotten consistent feedback from the operator that works with room and board that their experience with cloud control has been nothing short of impressive, right? G2 always asks a score. He says, hey, give me a score from 1 to 10. where one is fail, object failure, 10 is success. And the score that we got was seven.

[00:18:52] Speaker1:
And the repeated questions we asked,

[00:18:55] Speaker4:
Mark is to say, hey, tell us exactly, how do we get to 10? And systematically, we've improved week over week. We've gone from seven to eight. And we're very close to improving that score from eight to nine and get it all the way to 10. So we're systematically working with each and every single one of these folks. We're tennis, they are shouting off the rooftops, they're that excited. We've been working closely with Nutrient, we've been working closely with AMD, and we've also been working really closely with Tenaska

[00:19:24] Speaker1:
where the feedback was, again, absolutely remarkable.

[00:19:28] Speaker4:
I want you all to know that we're going in a controlled availability for both Cisco Cloud Control and AI Canvas at Cisco Live US in two weeks from now. By controlled availability, what I mean is exactly what you saw in terms of how we've defined the initial, the ideal customer profile, and you have a lot of these resources available to you today. You'll see the QR code again in a bit where we spend a little bit of time

[00:19:54] Speaker1:
giving you a call to action to be able to use the D-CLAD demo,

[00:19:56] Speaker4:
but with no further ado, let me hand this off to Rob to be able to walk you through this. You will notice that these demos are available instantly, and more additional sandbox and lab environments are being planned for Q1. But know that these demos will evolve very, very rapidly as we evolve security cloud.

[00:20:16] Speaker1:
I mean, Cisco cloud control in Canvas,

[00:20:17] Speaker4:
but with that over to you, Rob.

[00:20:20] Speaker1:
So as DJ said, we will be announcing this at Cisco Live and going CA, but we wanted to give you guys a very special preview. So this is actually in Dcloud. So as of today, you guys will have access to what we're showing you and we wanna get you exposed to it, start using it as soon as possible. We really believe this is probably one of the most exciting things that Cisco has ever come up with. I've been

at Cisco for a long time and this is the moment we've been waiting for, where we bring our platforms together to a single unified platform. We give a completely new AI-first, natural language-first experience to people. So what we're gonna come up with is going to make massive headlines in two weeks at Cisco Live. This is to give you guys the heads up what's coming out first. So what we're looking at is the decloud instance here of cloud control. So this is what the homepage looks like. And immediately you notice we've got a nice natural language chat interface right on the front page. You can ask any kind of question. And what's cool about this, it lets you ask across any Cisco platform that you might have, not just one, but it could be anything the customer has entitlement for.

[00:21:33] Speaker4:
You notice on the top,

[00:21:34] Speaker1:
you'll see that there's a Meraki intersite and security tab. The reason these are here is because I have added these to my favorites. If I pull down this little waffle menu, this nine-dot menu, you'll notice that I have access to Maraki, to InterSite, to HyperFabric, Security, WebEx Control Hub. This unifies all these platforms into a single place. So this is bringing these all together under a single Cisco experience, a single console. So I wanted to show you a little bit what this looks like. From here, I can click under Meraki and it's going to, it's one of those days. Here we go. We're going to Intersite and it takes me directly into Intersite. No need to re-login, no need to put in my identity. Immediately, I have access to see my entire server infrastructure, all the UCL servers. I can get into anything I would do into the Intersite world. Here's an example of a UCS server. It gives me access directly to these things. If I wanna go to try Meraki again, see if it's going to let me, there seems to be an issue at the moment, but maybe it's a login, try one more time. Okay, anyways, we will, there it goes. It's logging into Meraki. So it's pulling me into the Meraki dashboard, gives me full access to everything in the Meraki world. Everything you would have access to is here. There's no need to go again, re-log in from one different to the next. So what we're gonna see in time will be the entire Cisco SaaS portfolio is exposed here through Cloud Control. So there really only will be one place that customers need to go to. And again, this is available for customers at our CA.

[00:23:31] Speaker1:
Let's take you back to the home menu here. When we go to this nine-dot menu, You'll notice that the products here on the left, and there's gonna be a lot more as we go. But on the platform column here to the left, you see there's global inventory, topology. These are sort of like a common services layer so every product in the Cisco world of course has the ability to do some topology, it has its own identity. It has an inventory when you start to bring these together as a unified platform. What you can do is you can offer these as a common service. So, for example, if I was to click on inventory, this is not just going to show me the inventory of a product division, but it will be my entire portfolio of products that I have entitled to across whatever I might have. as a customer. So here I've clicked on it and it gives me this inventory screen which is showing me not just a list but it's things I need to care about, things that might be critical alerts, things that could be problems, the inventory where I quickly can start to assess and triage some

issues. If I wanted to see the actual inventory, here I can list it and it's giving me everything, literally everything the customer has from Maraki to HyperFabric to my firewalls. And we've actually in AI enabled pretty much everything in this platform, but if I want to just search my inventory, like show my firewalls, and it's going to go and search through all my firewalls, say show switches, and it will be able to pull up all my switches, whether it's Nexus switches, whether it's Catalyst switches, I can dig into any type of switch I want and get very, very rich information about that particular product. And you can see, it gives me information, which ones might have some P certs, some different issues that I need to be aware of. So now I have a single place to do inventory search across everything I have.

[00:25:31] Speaker4:
Similar thing for topology.

[00:25:32] Speaker1:
So I could click into topology. And instead of showing the topology of the data center or of the SD-WAN or of the campus network, what this will allow me to do is show unified topology that's stitched across domains across the entire portfolio I might have. So this is a very early preview. This is going to be, of course, dependent on what the customer has, but I can click into, let's say, the Mexico City Network. I wanna see the view of the topology here. And in this case, it's the data center. And it will show me, I've got, sorry, the CAT 9300s. It can show me the Nexus switches and will pull these together as a single unified topology experience. So what we're starting to see is a real cohesion of services that's not per product, but it's across the entire Cisco experience. And that's gonna be very different for customers. Even for sellers, the selling motion becomes different because now you're selling from a unified platform as opposed to doing trench warfare product by product across our entire portfolio. Let's just go back home for a second. And I want to just take you through one of the real centerpiece features here of Cloud Control, and that is AI Canvas. So again, Canvas is not something that's really separate from Cloud Control. These are deeply intertwined capabilities of the underlying platform. Cloud Control is what brings things together. Canvas is that natural language co-pilot for the entire experience. So I'll just take you through a few examples. So for example, here in the homepage, you'll see that Canvas is here along with actions. Actions allows you to aggregate all the events that are coming in and start to look at these and assess them, but it organizes them and understands them from an AI perspective. So for example, it's starting to see different related events that might be from the Maraki and it's telling you that you need to pay attention to these as a network operator. And if I want to investigate this further and go deeper into it, I can go directly into AI Canvas. And Canvas is a very, very rich, agentic experience that allows you through natural language to start to troubleshoot, to ask questions of the network, to do a lot of different things. Let's just go into here for a little shortcut. And what I'm going to do is create a Canvas board. And of course, this was announced last summer at Cisco Live, but we have gone a lot, a lot further since then. What you see here is a canvas. It's kind of like a workspace. This is where the network operator or security operator will do a lot of their day-to-day work. And you'll notice immediately here, there's a little bubble here that shows you what it can connect to. So it's able to talk to Meraki, to WebEx, to Firewall, to HyperFabric. And there's going to be a lot more here by the time we get to Cisco Live in two weeks. You're going to see Catalyst Center here

listed as a thing that we can connect to. On the left here, this is our chat panel. So this is where you can ask questions. You can start to do some troubleshooting, some triaging. So for example, using this prompt grammar, I can quickly get to prompts that are meaningful. For example, to show me an organizational summary. What this is gonna do is gonna go out to the network. It's going to look at all the different assets you have and it's going to try to summarize what's happening.

[00:29:00] Speaker4:
And you notice this box here,

[00:29:01] Speaker1:
this says routing to network intelligence to results on the bottom left. This is showing that it's a multi-agent system. So it's using AI agents to talk to cloud control, to talk to different aspects of like inventory, to looking at the assets and how they're performing. And it will immediately tell me overall health score, because this is in Dcloud, I've got 100% because everything's up and running. But if it wasn't, I would now have something in the knock where the operator can quickly use as a reference point to track how the network's performing and where it might have issues.

[00:29:34] Speaker4:
These are interactive.

[00:29:35] Speaker1:
I can look at what networks I might have, what clients are connected. And we'll go back to the chat and start to pull this information and provide these details for the user. So hopefully you guys can all start to play with this a little bit later today. But again, you can see that it's going to its multi-agent system. It's going to inventory to pull this out. And in just a couple of seconds, we will start to see this information start to appear and it's pulled the networks. So here's the six different networks that we have in this DCloud network here. And if there's any detail concerns I have, I can start to dig into these a little more. Let's say, San Francisco might be a network, the operator wants to do some investigation on, that's pretty cool. So let's pull this on and it'll put a network card that gives me details of the network. Let's go look at one more. Let's say Singapore, that could be another network, that there could be some issues that the operator needs to go and deal with. It gives a little pop-up. It's trying to pull live information, pulling it to see if there's any alerts. Of course, this one is okay, but we're going to put this onto the canvas as well. And very quickly, we start to get these useful cards here. This closes up. And I'm just going to do a quick organization. Now you can see that these different cards are here. This is where the operator is going to start to dig in a little deeper, start to troubleshoot, try to figure out the issues and what's going on. Now, just as a little treat for you guys, I want to give you one more little sneak peek into what's coming at Cisco Live. So what we showed you is D-Cloud. What I'm showing you here is the one that's going to go to production at CA at Cisco Live. So this is still in development, but this is gonna show some of these even further improvements that are coming by Cisco lifetime. You'll notice this one here, when I do the hover over, it's got even more connections to products. So we see things like ServiceNow, we see the Nexus. And again, you will see a catalyst center showing up here very, very quickly. Do you

remember I showed you the topology? Well, here from AI Canvas, we can directly connect to the topology agent. So I can pull up local network topologies. I can pull up the topology of SD-WAN as an example. And again, do you notice it's going to a topology agent. So it's actually routing to the topology agent trying to figure out more. We've added some pretty cool capabilities like what I'm gonna do in these topology cards. I'm just gonna take a little screenshot of this image here, this network image connecting to the internet. And what I'm going to do is just take a picture of this and I'll drop it into the chat and I'm gonna put it here and can you tell me about this network? And what it's going to do, it's going to analyze the image and it's going to parse it out and tie it back to what the customer actually has in their network. And if any part of this had issues, it would immediately start to identify these and help me to start to triage and troubleshoot them. So we've really taken this natural, not just language, but image capability where it can dig in. This is the SD1 network here we have in our lab test network, and you can see it's a very rich topology, and some of these alerts here tell me that there's a problem in the network. I could click on any one of these and start to investigate. We see that there's a critical alert here. And what this will allow me to do is start to go into a deeper analysis and investigation to try to figure out what's happening here. So, over here, we can see that that image seems to have already been processed and it did a pretty good job. I did one last thing before I passed it back to DJ. I'm going to go to something called the reasoning mode. And this is one of the most exciting things that we have done. This is, this is way ahead of what anyone at Juniper HP is doing with Marvis. This is really about using something called a deep agent technology where when I do an investigation, let's kick it off. This deep investigation is going to actually spin up dynamic agents for problem solving. It's going to pull content. It's going to pull data. It's going to actually write Python code that it teaches it how to solve this problem in a very iterative way using this deep agent methodology. And it takes a little bit of time, so we left it to the end. But it's essentially going to give an answer to the user after four to five minutes that you would never get from any other type of analysis, and it's really going to be one of the real centerpiece aspects that we have in AI Canvas. And when we've done our beta customer trials, this is a thing that really popped for them. They were solving problems that almost impossible to solve any other way. And I think it's got some of the most exciting interactions we've had with this product.

[00:34:29] Speaker4:
But that just gives you a little sneak peek.

[00:34:31] Speaker1:
This is all that's coming in two weeks. So there's a huge package here that's coming. Hopefully that gets excited. And we really encourage you to go to DCloud today, They start playing with it and start testing it. And hopefully you guys are pretty amazed and can start selling this. All right, DJ, back to you.

[00:34:46] Speaker4:
All right, thank you so much, Rob.

[00:34:48] Speaker1:
That was a fantastic demo.

[00:34:50] Speaker4:
I think one of the few things I wanna be able to take of it,

[00:34:54] Speaker1:
before I go into the call to action,

[00:34:55] Speaker4:
I'm gonna take a few extra minutes

[00:34:57] Speaker1:
and I know Sean's gonna be very excited about this, the fact that I'm gonna run over.

[00:35:02] Speaker4:
But folks, let me just answer a few of the common

[00:35:05] Speaker1:
themes of questions that I'm starting to see over there.

[00:35:08] Speaker4:
Cisco IQ and Cisco Cloud Control, what is the overlap? Let me make this super clear. You will be able to access Cisco IQ from Cisco Cloud Control seamlessly with a single login. We're bringing those two platforms together and if you have entitlements to Cisco IQ, your inventory that you see from Cloud Control which is controller managed and non-controller managed will start to bring all of that information together. you will be able to, these are not going to be two separate things. These are going to be one thing from a customer's point of view. Second question, is security cloud control going to be subsumed by Cisco cloud control? The answer is yes. There's just a single Cisco cloud control and you will be able to click in a security inside of Cisco cloud control and you will get all of the capabilities of security cloud control that people love is going to show up right there, right? But now with Cisco cloud control, you get all of the other capabilities as well, topology, inventory, canvas, those things come together. The third common question that I saw was, hey, if we are having, you know, some of these things start to come together, can I pick and choose the things that I want on the top? Yes, of course, you can toggle them on and off. You're gonna play with this in D-Cloud and you can understand this. Speaking of D-Cloud, you're spot on. We need to put more resources in a D-Cloud to be able to make it capable and make it more functional. So you're not tripping over as you're doing some of these demos. Now for the on-prem controllers, we are connecting them using the tethers. Catalyst, Nexus, Firewall, all of these on-prem controllers will come in and you will be able to manage them using Cloud Control. The key part over here is that those tethers will be slightly different for each one of those, right? Some of these will require you to do the extra provisioning, but guess what? We're gonna make that seamless as well. So the customers do not have to be actively thinking about, oh, do I have to provision global overview? That will be provisioned automatically to be able to manage a catalyst environment so that you can just, you know, you can use cloud control, get the benefits of Canvas, get the benefits of inventory and make this all work together. Last piece I'll leave you with is I know that there's a question about FedRAMP and then how we're thinking about market access. For those of you who

missed it, please go back to the recording. I showed you how we're thinking about customer profiles and we're focusing primarily on, you know, commercial select, and the enterprise side of the house right now, right? Those are the ones that we're focused in North America and we're going to primarily deliver those capabilities before we start to expand the market access to outside more globally and then make it available for federal and government side of the houses. So just make sure that you take a quick look at that slide. That's how we're expanding and that's naturally how we will do this because we want to make sure we're getting all of the feedback and expanding our capabilities. Now, Sean, I know that we wanted to put up a slide, which is going to be the call to action slide. Is that something that I'm doing?

[00:38:09] Speaker1:
We're going to, before we jump into call for action, we've got a special message from Chris Naderos, one of our sponsors.

[00:38:18] Speaker4:
Let's do it.

[00:38:19] Speaker1:
Team, that was an awesome demo and I couldn't be more excited to put

[00:38:25] Speaker3:
a bit of a sales point of view on Cisco Clock Control and how we think about how we leverage this post Cisco Live. So for those of you who haven't met, my name is Chris Medeiros, a work in security organization. I lead our velocity and incubation teams. We've brought a lot of different technologies to market over the past couple of years in security. And so it has to be the exact sponsor from a sales perspective for Cisco Cloud Control. And so I'm really excited to chat with all of you. I think we have a really unique moment in time to go think about how we've leveraged this launch and have a great Q4 and build also pipeline for FY 27. So first, the market is flooded with agentic ops and AI ops. You're hearing all that noise right now. You're hearing the things about Mithos. Every competitor claims to have the silver bullet. Our job as the trusted advisor at our accounts is to go cut through that noise and expose the gap between marketing slides and reality. And so I'm really excited to share with you today a few thoughts that we can have as a sales organization. And again, how we think about this announcement and how we take it to market. So first, you just saw an amazing demo. What Cloud Control actually does is built on a unified correlated telemetry foundation, giving agents and humans full operational context

[00:39:39] Speaker4:
across every domain.

[00:39:41] Speaker3:
And so what that means for us at Cisco, we've got breadth and depth. We've got a number of different architectures and technologies. This brings all of that together. I'm gonna say that again. This brings all of our architectures together. and there's two key products that bring this to life. One of which is our AI Assistant, which actively investigates and takes action on your behalf. And the second is AI Canvas, which is a shared workspace where agents visualize, data and

execute tasks across team. This isn't just a standard chatbot. AI Canvas is multiplayer. Context never gets lost across handoffs, escalations or team transitions, so your customers are always in a good spot. And what you're gonna hear too is how we think about competitors as it relates to Cisco Cloud Control. You've probably already heard this in the market and HP talking a big game, talking about how they can go and solve for these problems. The reality is their customers still have to log into multiple different UIs just to do basic operations. For Juniper, they're pushing a large experience model that's really very generic and lacks domain specific precision that we have with our deep network model. They can't compete on that front. Arista is a formidable competitor, but their reservability is still trapped in the data center. Their AI assistant is a marketing layer, and it's not an engineering-led, eugenic solution like ours. Palo is probably the closest to where we are, but their internal fracture creates a situation where they've got two separate AI stories, one via Cortex, one via Strata, that they're doubling customer complexity with and not simplifying. And that's where Cisco comes in. We have the common thread, right? None of our competitors have the portfolio of breadth and depth that we do to unify the full experience and especially the way the cloud control does. And so why this matters for your deals? The first thing is this is a fantastic conversation starter and we'll talk about the different scenarios for Q4 in particular in a second, but beyond that, there's no budget that's required. This is included with all eligible Cisco licenses. And so you don't have to worry about your customer going off and finding a way to fund this in Q4. This is a way for you to differentiate with customers and prospects in Q4. And this is really a true cross-domain troubleshooting as a strategic watch type moment for customers that we should think about. This allows us to surface visibility gaps that are single domain competitors simply can't address. And I want that to sink in for a second. This is something that our competitors really can't address. And this should open doors and accounts where we've had challenges getting footprints

[00:42:13] Speaker4:
in the past.

[00:42:14] Speaker3:
And I'll talk about that in a second as well in terms of how we think about prospecting and leveraging this to get into non-Sysco accounts in the future. Beyond that, this will help you build and improve your land and expand motion, right? And so more domains feeding into AI Canvas means more value for customers. And so if you've got a Meraki customer that doesn't have Thousand Eyes or a Thousand Eyes customer doesn't have security, right? There are ways that we can go and get those customers bought in and bring this together, which only adds and multiplies the value that they're going to see from Cisco Cloud Control. And this also shifts the conversation from feature to feature on a siloed perspective to true business outcomes for our customer. We've all heard of MGTR, right, or mean time to resolve. That's how long it takes your customers to identify, diagnose, and fix an issue. This helps improve operational efficiency and reduce risk for our customers while helping them to also do that in the most efficient and effective way. And so as it pertains to Q4 specifically, there's really three key ways I want you to think about how you can leverage this. And so if you've got solidified deals in Q4, Cisco Cloud Control is gonna allow you to go strengthen those relationships and strengthen those deal cycles by showing them the future of state vision and where we're going. I

think it's really gonna help you to build confidence with those customers. The second is if you're still looking for Q4 deals and you need to go work on your pipeline, This is a amazing way for you to go again, take that Meraki customer and think about how do we position Cisco cloud control to then get them interested in security cloud control or thousand eyes, for example, right? And so this is a true one plus one equals three. If you can go position the power of Cisco cloud control, this is a way for you to go think about how you get more products and obviously more spend with your customers in Q4. And then lastly, this is a way that we can enlighten non-Sysco accounts.

[00:44:11] Speaker1:
I talked about this earlier.

[00:44:13] Speaker3:
You have prospects, people that haven't been bought into Cisco or the Vision. This is a lot of the feedback that we've gotten.

[00:44:19] Speaker4:
There are, our solutions are desperate.

[00:44:21] Speaker3:
They're not tied together. This changes the game in that regard. And I want you to really think about how you can prospect in Q4 to go tell this story, educate the market to not probably only close deals perhaps in Q4, but certainly strengthen your FY 27

[00:44:36] Speaker1:
opening day pipeline as well.

[00:44:39] Speaker3:
And so in closing, I'm really, really excited for this announcement. I think we have the portfolio, we have the unified platform, and this is built into our expansion story. None of our competitors can say that. And I think if we truly lead with value, right, be a trusted advisor to our customers, this is an amazing wedge that we can use strategically in all of our accounts to go move the business forward. I wanna thank you all so much for the time today

[00:45:04] Speaker1:
and let's go ahead and move to our call to action. Awesome, DJ now back over to you to help us out.

[00:45:11] Speaker4:
All right, folks, you know, here's the thing. This is a, this has been a labor of love. And this is not just a single team, you know, the cloud control team, the canvas team have been working maniacally, but it's also every single one of the teams

[00:45:26] Speaker1:
that come together, the product organizations,

[00:45:28] Speaker4:
whether it's the Meraki, the Catalyst,

[00:45:30] Speaker3:
the, you know, the Nexus teams, the Splunk teams,

[00:45:33] Speaker4:
every single one of the teams have basically said,

[00:45:35] Speaker1:
hey, listen, we're going to prioritize this.

[00:45:37] Speaker4:
We're going to make sure that we start coming across as a platform organization, and it's absolutely remarkable. Every single GM, every single SVP, everybody's thinking about this as,

[00:45:46] Speaker1:
hey, we're going to now enable our field to maximally succeed.

[00:45:51] Speaker4:
We are going to enable our sellers to be able to get out there and talk about this in a way that is a compelling show of force. Please take the time to take a look at our D-Cloud demos. Those are the links. Grab the QR codes if you want. There's really good amount of resources that we're starting to put together inside of SalesConnect or the sales resources at Cisco.com, you should be able to find the FAQs. A lot of the questions that you've asked over here have already been answered from a positioning perspective from like being able to communicate very crisply and the timelines are right there. You know exactly when each of these capabilities are dropping and will you make sure that we're correct and if there are things that you want us to upgrade and improve just let us know the teams on standby to be able to make sure that you have the right types of resources. There are two other things at the bottom. You'll notice that these are the WebEx spaces. They're called Ask Cisco Cloud Control and Ask AI Canvas. We're going to try and merge these at some point, but you know, these are the two WebEx spaces where you can jump in, sign up, and ask the questions. You've got product managers, TMEs, engineering leaders, everybody's in that space, and we have already thousands of you all from the field that are in those spaces asking these questions and you expect us to rapidly respond to these things. Some of these might be coming from an AI agent, so don't be surprised. But we made sure that we put all of these things together for you all. Just make sure you take a look at these resources and give us feedback. All right, with that, thank you so much, everybody. Back to you, Sean. I really appreciate you all joining and tuning in. Let's have an amazing Cisco Live. We're going to really light the whole thing up on fire. It's going to be fantastic. I'm

[00:47:26] Speaker1:
really pumped about this. Thank you, DJ, and thank you to all of our presenters and and panelists for answering your questions today. We look forward to seeing the impact you make. Have a great rest of your day.
