```

[00:00:03] Speaker1:
So let's go in and talk about Nexus dashboard first. So first of all, there's a number of prompts that we can run here. And my suggestion is always coming from a top-down view because that's really how a customer might think of this. So first of all, I'm going to ask the question, hey, using Nexus dashboard, show me all, show me a summary of all my fabrics. As you can see, Nexus dashboard actually has a really incredible skill that really gives that full comprehensive view of all my data center switching fabrics. right? It's also going to talk about for this particular controller, these are the fabrics, right? For this controller in San Jose, these are the fabrics. So, you know, you have a holistic view right here. So the natural next step is to first of all, you notice how which ones right here are going to be in critical state. And that's probably what you want to focus on in this demo to kind of get into a deeper understanding of what the problem is. So then what happens is that I can type in a follow up problem. Hey, show me the anomalies for the SJC ACI to fabric, which you saw earlier was part of the critical anomaly level fabric.

[00:01:00] Speaker2:
So then what happens here is that it then goes into a little bit more detail

[00:01:03] Speaker1:
for that particular fabric. It talks about how many are critical, right?

[00:01:06] Speaker2:
What the score is.

[00:01:08] Speaker1:
And then talks about exactly what is critical for that particular fabric. It talks about, Hey, there's going to be some ingress packet drops. It talks about some CRC errors and then gives you a deep dive into all the other ones as well.

[00:01:20] Speaker2:
But you know what?

[00:01:21] Speaker1:
For the sake of the demo, I want to focus a little bit more probably on the, uh, to really emphasize talking about those critical ones because as a user, that's what I would probably care about. And then you can also talk about how the fact that we're also highlighting, right? If anything you can read out from here, what exactly it is that you should care about as a customer. It just summarizes exactly that. And then, you know, look at this. I can also mention a few other things. You know what? Well, I want to understand which switches also in that particular fabric are affected and what exactly is their hardware health. So I can notice where to focus, right? So this is just another path that we can go down, right? It's really about emphasizing the whole natural language prompting that we can do here to

[00:02:00] Speaker2:
just keep diving into any direction that as a user, as an admin, I might care about. And you had all these prep beforehand, so you had all your prompts and you have this so you are not typing these prompts in front of the customer right now.

[00:02:15] Speaker1:
I'm not. Now you absolutely can.

[00:02:17] Speaker2:
Yes. You're going to have to take a couple of minutes. Prepping perspective, this is something that you would have prepared beforehand, like you're showing now. So that's, that's exactly what you show it awesome.

[00:02:28] Speaker1:
Yeah, I would absolutely recommend us to do this also. Anybody to do this, it would just make it so much easier for you and less nerve racking in case LLM comes back with something that you're not expecting. So if you can see right here, right? Then we go down a little bit further, it's able to list out all those hardware switches, which ones are critical, which interfaces have issues. Right. And so you can see it, we're going further and further down into this rabbit hole of figuring out where the problems are really located.

[00:02:51] Speaker2:
Right.

[00:02:51] Speaker1:
It tells you, Hey, in this particular node 202 for leaf two, this is where the problem is that this is what you should focus on.

[00:02:58] Speaker2:
And then you go all the way down,

[00:02:59] Speaker1:
you can even ask follow up questions, you know what? You know, give me the overall priority of what I should be doing next across all the things that we have seen over here. And it just summarizes every single thing that we just saw earlier for you from Angus Packard Drop to Stomp CRC error all the way down to the very

bottom for all the other priorities as well. So you can see how powerful it is from Canvas. And this is just for Nexus dashboard, but you can imagine you could do this for many other products as well.

[00:03:25] Speaker2:
Now, I think that typically speaking, a customer would be pretty impressed.

[00:03:28] Speaker1:
I, I'm hearing from whenever I asked them these kind of questions, Hey, what do you think they're like, wow, this is pretty cool. I would absolutely use this.

[00:03:34] Speaker2:
What do you think? I love this. And also again, our customers come from different domains because now we are unifying domains. So having an example, we saw a lot of networking in the previous example. So having, I'm first networking, I should say, so having another example that is more data center focus will help have the talk track that actually resonates with those customers. So this is awesome. This is awesome.

[00:04:04] Speaker1:
Exactly. You know, there's so many different flows you can do here with these different products. So you know, you really got to make sure you're testing out a couple of these, but you can absolutely copy exactly what I'm doing here to make sure you have a compelling story.
