```

[00:00:03] Speaker1:
Right. So catalyst SD when I'm starting off here and asking the question, hey, summarize my catalyst SD one deployment. And as you expect, that's exactly what it's doing. It tells you exactly what sites or routers, well, how many circuits there are here. But ultimately speaking, it's killing you where we're seeing any sort of particular issue. Right. We're seeing that there's a low availability here. Right. And that's probably one of the things that I would like to most focus on. Right. If I go down to the bottom right here, it says, in fact, the action item section tells you exactly this zero availability. That's a very, very tellable thing that you're going to be able to see and catalyst SD when, right? So based off of this, what I can go ahead and do, what I did was I, Hey, you know what? I'm just a follow up on that action item at it's get canvas is telling me directly here. So Hey, site one on one is showing 0% availability, but actually it seemed like the circuits are up.

[00:00:51] Speaker2:
What should I do?

[00:00:53] Speaker1:
What do I, what's going on here? So canvas will be able to take that context. And again, to follow up, it's a multi turn, you know, conversation here takes that context and tells you, Hey, you know what? This is what I've been able to see from that particular site, right? And candle is SD when agent does an incredible job at being able to find out what that root causes is that there's a BFT failure, right? BFT for those who are not familiar, it's like the heartbeat that helps us to understand that both sides are actually up.

[00:01:16] Speaker2:
Right.

[00:01:17] Speaker1:
And it tells you, Hey, why circuits are showing up, but availability is at zero. Hey, BFT sessions are down, data plans down, site availability is down, and it talks

about, it gives you an overview about what that means. And then it tells you, Hey, this is what I believe that you should be doing to actually fix the problem, right? Gives you some, uh, show commands that you can even run on your devices as well and tells you what things to check and what things to do next. So first of all, this, this is already somewhere you can probably end the demo. You just show that, Hey, I was able to go from a top down view all the way down to where I should, what I should do next step to solve a problem. What you can even do as just a plus one is I can, you know what, I want to go ahead and write this into a ticket service now ticket, whatever ticket and they'll tell you exactly that is summarized that exactly how it believes that you should be able to format that into a ticket and all the information. And so all that information for remediation is there. And in fact, for Canvas, you can even go ahead and export this to a PDF and just upload it yourself if you like to as well. So this right here just, you know, is one other flow that I would say that, hey, allows you to troubleshoot site to site to site using Catalyst SD-WAN agents as well.

[00:02:24] Speaker2:
Yeah. And I like the fact that we are starting with a general question. We all know that prompt engineering is important and asking the specific is important but sometimes we don't know what we don't know so start with the how is my environment doing and then once that bubbles up something that we need to investigate that's where you went with more accurate or more precise I should say not accurate more precise prompts so showing those elements are also very useful because customers are asking what are the new skills that my network engineers will need to have and prompting is one of those. We are seeing that as well. So I really like this.

[00:03:04] Speaker1:
Absolutely. I think it's just a no-brainer for how we should be doing these kind of demos. It just resonates so well with customers when they see that top-down view and have all the context into where the problems is and what exactly they should be caring about and looking at.
