[00:00:03] Speaker1:
I think to wrap it up, I want to showcase just one last flow here to go into a little bit of security realm as well. So you know, the firewall team here at Cisco has built an incredible tool that's helping us to troubleshoot site to site VPN. By the way, for the record, all these products are going to have so many more tools coming out capabilities coming out in the next month and next two months. So look out for those. But I want to showcase one key one here that's all that's available right now in D cloud, which is, Hey, what, what site, site to site VPN tunnels exist? Cause we all know fire or secure firewall has an ability to create these site to site VPNs through for that secure and cryptic connection between two sites. So off the bat, what we're seeing here is that it summarizes it grab, it goes to security cloud control into secure firewall grabs information. That's, that's, but let's put our eyes down to the ones that are red, right? Again, so Rome Munich, topology, right right here in San Jose RTP, these seem to be down. And in fact, if I go down a little bit further. It gives me some additional information, right? About what that, you know, some additional things that I should just note off the bat. But, you know, the key thing here is that if I see something is down, I want to know why is it down, right? What should I do? What the problem is going to be? So then I'm going to go ahead and deep dive further and ask the question, right? About, Hey, my site is a VPN tunnel for San Jose, RTP has connectivity issues. Help me to troubleshoot. And right away firewall team has built an incredible tool that allows it to really deep dive into why something is not working. And in fact, it shows you the step by step about how you should be doing troubleshooting. It tells exactly where the issue is happening. But so it seems like pinging is working, UDP is working, but ISOCAMP and IPsec are completely failing. And it says the reason here is because that there's no essay peers. All right. And there's no essay on either peers and there's no essay established for this one right here.

[00:01:44] Speaker2:
And if you go down further, it gives you a further root cause.

[00:01:47] Speaker1:

It doesn't even tell you to investigate. It tells you exactly what the problem is. It tells you that the tunnel is pointing to the wrong IP address. And also, there's no tunnel group configured for pure A's IP, so no wonder things are not working. But the amazing part is that firewall team has made it so that when it because of these because it's able to figure out what the issue is, it's also able to tell you a recommended next step of exactly what you should configure directly on your firewall through your CLI commands. You can just run copy in this and directly paste it there, right, of course, including your keys. So that ultimately speaking, you can go ahead and run these recommended next steps and verify the change and just fix the problem just with one single flow. flow. I think that this is an incredibly comprehensive, just from top down problems, problem identification, all the way to recommend a next step, kind of a flow that would absolutely resonate with any firewall customers. I love that. So yeah, I, you know, I think that we've gone ahead and hit so many points across with this fireside chat today, Lila. I know, I know lots

[00:02:45] Speaker2:
of information for whoever is going to be delivering our presentation. As we said before, you don't need to use everything. The recommendation is get to know your customer and understand what domains and what domains controllers they have so you can pick and choose these use cases so that they actually resonate with your customer. Go and download the BDM-TDM from the SharePoint site. Actually, bookmark the SharePoint site. It's very good. It's always updated. Join the Ask Cisco Cloud Control Space, ask questions there, and the most important thing at least for this fireside chat is going to DCloud and practice your demo. So get acquainted with the environment and practice so that you can get as good as Richard. So that's what we all aspire to. So anyway, thank you so much, Richard, for doing this with me. Hope everyone finds it useful. Let us know if you want to do a follow-up on any other use cases and topics. And with that, go ahead and demo Cisco Cloud Control with AI Canvas.

[00:03:55] Speaker1:
Thanks for having me, Lila, and good luck to everybody here.
