[00:00:04] Speaker1:
So, Declore is a very powerful environment to demo cloud control and AI Canvas, but we've been getting questions on what's the best way to demo how to uncover AI Canvas use case. So, Richard, I wanted to partner with you. You have a lot of experience in, you know, demoing AI Canvas, you've been on stage at Cisco Live. live. So today I wanted to ask you how you demo, how you explain the solution to your customers. So I'm Lila Rousseau, Principal Solutions Engineer and Richard, if you want to introduce yourself.

[00:00:42] Speaker2:
Absolutely. Thanks for having me, Lila. My name is Richard Jiang for those who know me, and I'm a Senior Product Manager on the AI Software and Platform team, specialized specifically in AI Canvas, but also Cloud Control as well. So incredibly happy to walk everyone here through exactly how we would talk about the solution in DeCloud.

[00:00:59] Speaker1:
Yes, and the plan for today is to, we are going to talk about technology. Obviously, we need to explain what the solution is about, but the focus is going to be on the demo, what to demo and how to demo. So with that all yours, how do you start the conversation?

[00:01:16] Speaker2:
Yeah, absolutely. You know, what I would actually recommend the team to do, first of of all is make sure you've not already down that TDM on sales connect. We have a lot of great content there. And I would always say to base the foundation about why we're building the solution off here first, but at least the first couple of slides. So the way I would talk about is that, Hey, we're here to talk about cloud control and you know, why are we building cloud control? Why are we building canvas? It's the big new shiny object. It's the platform, right? But the foundation about why we're doing any of this is because number one, we all know that Cisco is that beast that's building products and solutions across the IT domain, across

networking, security, compute, observability, collaboration, all these different things, right? We are the best in market to be able to now unify it all, all together because we have all these different solutions that we can and have the additional insights to do so. And you know, we want to get across to the field, to the customers that, Hey, it's really a no brainer that we want to do these things, right? Why would we want to unify? Because if you can see all the data all in one place, it allows you to be able to act more intelligently act faster and ultimately get your customer to a resolution better than before. And then the question is, Hey, why do we need cloud control? Right? We, what about just a genetic AI? The point of it is, is that ultimately if you want everything to work together, you need everything to be under one roof. You need a platform that handles everything from authentication to everything else with data. So that's what cloud control is, right? This is the part you want to really anchor on that cloud control is that one singular platform that will allow us to be able to bring every single one of your products and everything that a customer would use in their daily operations into one single place.

[00:02:53] Speaker1:
And that's what customers have been asking about for a long time, right? They even say, saying, hey, you have a lot of great... controllers and dashboards, but we are drowning and going from one place to the other. So I think by bringing all these domains together, we are actually giving what the customers have been asking for for a long time.

[00:03:18] Speaker2:
For a very long time, Lila. It's about time we're doing this and we're doing it correctly this time. So as you can see right here, we're starting off strong, we're bringing on many of these core products with so many more, just coming in the next couple of months. And it's not even just about bringing in products, and especially it's not about bringing a small chunk of the product, it's about bringing the entirety of each and every one of these products while tying that authentication to a single sign-on in which you're able to just log in once and have access to every single one of these things, but not even just that, right? Big part of it is also that we're able to take the data from all these different platform controllers and different observability products and be able to reason on top of that and and bring it all together. So you have one inventory, one topology, one alert notification system, one place to manage licensing. So then that's just a foundation of the platform itself. Now, on top of that, that centerpiece right here with the GentikOps with AI Canvas is really what's gonna let this really just fly. Because as we all know, we're in the age of a Gentik AI. I can now utilize that power of agents, MCP servers and so on to allow me as a user to be able to reason across my entire ecosystem. In fact, not just with Cisco, but beyond as well. Now, this is a little bit out of the scope for today's content, what, which is going to be about marketplace agent builder and app builder, but we're going to be able and very soon allow you as a user and especially us here at Cisco to demo it, to be able to reach across to things like serve service now info blocks, blue cat, everything that would really just make it so that from the platform here in cloud control, so we can access 100% of everything that a customer would use in their operations. What do you think about that, Leela?

[00:05:03] Speaker1:
I think it's awesome, and I think that's going to really complement a lot of the things that we are already doing with Cisco products. We need those extra elements to provide a complete solution for the customers. Now, the question that I have for you is that how do you transition from the slides to the demo? How do you pivot for the, when you are in a customer session.

[00:05:28] Speaker2:
You know, my suggestion is that we always want to make it so it's demo first. So typically what I would do is that I go through these couple of slides first, just to set the stage problem statement, what's the obvious about building a platform and a Gentigov solution like Cloud Control and Canvas. And then from here, I would directly just transition into our DCloud tenant where it allows us to be able to go and demo everything live.

[00:05:51] Speaker1:
And I think it's very important you are mentioning This is D-Cloud, so what Richard is showing is not a separate instance that he has somewhere hidden. This is actually D-Cloud and we all at sales and our partners actually, we have access to this exact environment.
