```

[00:00:03] Speaker1:
I want to make sure that everyone here is very familiar with how exactly we can go through the flow and give a compelling demo to anybody, but either whether it's a single customer or on a larger stage, DeCloud definitely has a number of things that you can showcase that's very compelling today. So what I would say, first of all, is that we're landing here in the home page of Cloud Control. We can see a number of things off the bat, such as our unified assistant sitting in the very center that allows you to reach every single product that's provisioned to Cloud Control, our Canvas tab, Actions tab.

[00:00:33] Speaker2:
But what I want to first go to right away

[00:00:36] Speaker1:
is this 9.menu, which allows us to see everything that we bring here as terms of capabilities from Cloud Control. And what I would first highlight is, hey, we are able to see three things, right, products. What all products have you provisioned to Cloud Control? The platform services that really allows us to be able to see additional information about every single one of these products and more, as well as our applications. Now, off the bat, you can also mention that at the top, It's pretty empty at the, when you first launched log into cloud control and we can talk about how we're able to actually, you know, customize the top bar so that it's based off exactly what you as the end user would utilize on a day-to-day basis. Now, I would, I would go here first. I would go ahead and talk about, Hey, let's talk about being able to go into a singular product. Right. I want to showcase right off the bat that cloud control allows you to be able to access any single one of your products incredibly easy without having to re-sign in earlier. I just clicked on Maraki dashboard and as you can see, I'm logged into the entirety of Maraki without having to do a single sign on. And in fact, I can also see the cloud control header at the very top with all my pinned items, AI canvas, as well as assistant at the top. And I like to mention this is the entirety of the Maraki dashboard. It's not a small sub dashboard. It's really in the entire product. And that's one of the

powerful things about cloud control.

[00:02:03] Speaker2:
That's a very important point. So we are not recreating dashboard inside of Cloud Control. The customer doesn't lose any capabilities. They actually gain that seamless navigation that Cloud Control provides. So this is a very good point, Richard, that you are making and we need to emphasize in those customers conversations, I think.

[00:02:27] Speaker1:
Exactly. And let's just go for one more just to prove the point because, you know, Meraki is one SSO. InterSite is one entirely separate one. So let me try clicking on InterSite right here. And as you can see within just a couple of seconds has brought me into the entirety of InterSite and I can click on any single one of these tabs and expand on any of these things and it'll be able to let me get there. Really a game changer from anything that we had in the past.

[00:02:54] Speaker1:
Now that's speaking the obvious. I think that first off all the bad, this is something that customers are already going to have a wow moment. They don't have to log in a second time before we all know how much of a pain that could be. Not even just for when we're operating in IT, but just for anything, any multiple logins, you have to remember passwords, you have to go through multiple MFA's, so on and so forth. So that's the first point we want to get across. The second point is that we want to talk about platform services. How are we really getting all this data from all these different products and really just making the most of it? Now, the lowest hang fruit here is going to be inventory. We can, for the very first time, without using REST APIs and building our own dashboards, see one singular view across every single one of our platform controllers. As you can see right here, I'm going to the list view of inventory. And off of the bat, we can showcase right here, there's a source column that shows us every single one of our hardware assets. And we can see Nexus dashboard, Cloud Control Hub, Security Cloud Control, SD-WAN, Meraki, Security Cloud Control, everything all in just one singular view. And not even just that, it also allows us to see insights that's based off all the different attributes of every single one of these hardware assets, such as, for example, it says, oh, there's devices affected by known Cisco piece or advisories or Hey, active network anomalies needed an investigation. So these, for example, are not actually even static. These are dynamic insights that are there based off whatever attributes are there for every single one of these products. So they can change, in fact, on a day to day basis to give you as a user the latest and greatest of what you should

[00:04:27] Speaker2:
be paying attention to across every single one of your platform controllers. I think this is a pretty game changer. This is very game changer. This is very powerful in the world where we are going to see methods results. Having centralized inventory of all our assets in a single place and being able to track those assets is absolutely key. So Cisco Cloud Control is a very, very important a component for this as well or anything, Glasswood and Mythos, Project Beacon, et cetera. So this is, don't discount the value of this. Not every customer is really tracking assets as they should. So this is going to be very powerful for those customers.

[00:05:15] Speaker1:
Absolutely.

[00:05:15] Speaker2:
And you know what?

[00:05:16] Speaker1:
Just to throw in a little bit of flair, we've even gone ahead and put in a little bit of generative AI in here as well. We're allowed to now not just be able to search up keywords, which we're all used to when it comes to filtering anything, you could type in actual full sentences here now as well to search up your within your assets. And we know what you're going to be able to see here is that it's not only showing me my network firewalls, my secure firewalls on security cloud control, but it'll also be able to show me things like my MX's here as well. So really just one singular view and you can now do everything in more of an intent based fashion by telling it what you want.

[00:05:52] Speaker2:
And you can export from there. So customers that like their report situation and they're always asking, how can I get a report of this on that? Then you can generate a report from there and get whatever assets you're looking for. So again, very, very powerful.

[00:06:08] Speaker1:
Exactly. And, you know, it's not even just that, if you go back to the, back to this page here, you can also see additional insights, like a full breakdown of your Cisco platforms or your security exposures, compliance postures. And this is just really the tip of the iceberg. We're only currently in controlled availability, going into general availability soon for the U.S. This is going to, you can expect this to massively expand every single one of these metrics. All the intelligence is going to be significantly more as we just go upon the next couple of months. Now this is a high level when it comes to the inventory. You guys can play around with it and get a lot more deeper into every single one of these different widgets. Now I want to go one step further. We have all this information from all these different hardware assets. Now as a customer what I want to do is I want to be able to visualize this in not just a 30,000 feet but a 300,000 feet going down to be able to see all my different sites, both campus branch, all the way to over the WAN into my data centers, and that's exactly what this topology view is going to be able to do by aggregating all that information from my platform controllers as well. So, you know, Leela, I think that the one thing that customers first of all would care about is, hey, if I'm looking across all my sites, which ones actually need attention? Wouldn't

[00:07:28] Speaker2:
you agree? A hundred percent. So I think these kids have a visual representation of what's that's going on from that perspective, from a health perspective. So how do you show that? How do you explain this to the customer? What would be your top tracking topology?

[00:07:47] Speaker1:
Yeah, absolutely. So, you know, beyond the fact that it's bring, bring all that information through the platform controllers to visualize such a thing in a very intuitive way is that off the bat, it's very simple.

[00:07:58] Speaker2:
I can see exactly which one of my sites are poor, have a warning or a healthy.

[00:08:04] Speaker1:
And as always, we care about the ones that are poor because we need to take action right away. And it's very visual. As you can see off the bat in the map, there's clearly an area right here. There are six sites and it has a red area. So let's click directly into here and let's click onto one of these right here. Let's say click on view topology. And you can see we're able to go from this entire globe view all the way down to a very specific site. This one's called RTP, NXOS, and you know, it shows you exactly how everything is connected. border gateways. I can see these other spines, right? And I can click into individual. This is even and it shows me exactly what's going on. It says, Hey, like there's a traffic score that's now healthy, right? There's some additional device information. So this is what I would be able to showcase that. Hey, I'm able to go from any sort of view all the way down into a very intricate device level view to see exactly what's wrong with my network and be able to understand perhaps what should I do next? what should I troubleshoot next? If I didn't have this view, I'd have to go into multiple platforms, the multiple different products to be able to find this information. And it's not very easy for me to be able to connect it from one particular product to another. But now it gives me that full comprehensive visibility view.

[00:09:21] Speaker2:
So what are those blue lines? So how do you explain those blue lines there?

[00:09:26] Speaker1:
Yeah. These are data connections between, for example, the RTP and XLS leaf all the way to this switch, for example. Right. So it tells you exactly how the data is flowing across every single one of these. So like, for example, a hardware connection. So before, again, like it's complete. It's someone black box unless you're really just at specific admin for that product, but now you see how everything is connected across the board. All right. For, for example, just for this site.

[00:09:52] Speaker1:
Now, what else you can do here is that, you know, say, say, for example, this particular device, I can even click on view and inventory. it'll bring me back to the inventory so that I can see the additional information about this as well, along with the rest of my different devices. So you can see this really interconnected experience that allows us to be able to view whatever we want very, very easily. Now, I will even give a hint here that in the near future, we're also planning to make it so that majority of context that you're seeing here in Cloud Control, if you see an issue, right, right now today, it's going to be within actions. You can pass it in the canvas to do some deeper investigation, you'll be able to pass it from the apology as well, right? You'll be able to pass things from inventory as well. So all

these things will be on the horizon to make it so that when it comes to investigation, it's no longer just a pure dashboard play, a pure dashboard experience, but being able to pass context so that agents are able to do

[00:10:50] Speaker2:
those things for you going forward. And I have a question for you. So how do you, this is not for customer, this is for the accountings demoing this, How do you get this better view of topology? Are you using full screen? Because sometimes when you don't use whatever you're using, you might see a reduced view. So what would be your recommendations for account teams to properly demo topology? You know, absolutely full screen. You know,

[00:11:19] Speaker1:
I would say that this applies to just demo in general. I'm hoping everybody here is just full screen. In fact, you should even use something like this where you're clicking view and just hiding the entire full screen toolbar. Like that's just even that's even a better

[00:11:33] Speaker2:
that's even better. That's a great recommendation and I wanted to point it at that out because if not sometimes you see a reduced view of topology and you can you can be jumping around and struggling a little bit. So this view that Richard shows it's the best way to show topology. So I wanted to point that out, to point that out. Yeah, absolutely.

[00:11:55] Speaker1:
Full view, yeah. Absolutely. Yeah, we don't want to miss a single pixel of this very beautiful user experience right here, right? All right, so I think overall this is a pretty solid overview of topology, right Lila?

[00:12:10] Speaker2:
Yes, yes, that's awesome.
