```

[00:00:03] Speaker1:
The key thing I want to talk about with Canvas to get across the point to customers is number one, your IT operations today, you can see symptoms, but the issue can be anywhere, right? We all know this. People like to blame the Wi-Fi for everything. That's an example I love to give, but it might not be a Wi-Fi problem. It could be a switch problem, right? It could be a routing problem. It could be an ISD problem. It could be anything else. So we're here now having to figure out exactly which segment the problem is in. So in this particular scenario in the slide, we're saying, hey, why is my application slow? Could be any one of these things. In fact, I don't even know where to start. And the beauty of CAM is that it can go ahead and do that all for you. You tell it your intent, it looks across every domain for you, and says, hey, the problem is here in observability. We're here. The problem is in networking, whatever it is. So that's one thing you really want to get across is that you can this. Ultimately, it can do all these beautiful things, generating visualizations. but ultimately we're trying to make it so that investigation is just much faster for you across the entire landscape of where you operate as a customer. Now, last thing I want to mention, and we can jump right back into the demo, is that this is a very useful slide here when it

[00:01:10] Speaker2:
comes to architecture to make sure that your customers, it's not just saying, oh yeah,

[00:01:14] Speaker1:
look, I don't know what's happening in the backend and somehow data comes back to me. We want to ground them in the reality of how things all work. And that really helps them to understand and also ultimately trust Canvas to provide them with the best data and reasoning output that they could probably expect. So this architecture right here, I'm going to give a very high level just understanding so how you can narrate it. The ultimate way of how it works is that when a user enters their prompts, it goes into what we call our orchestrator agent.

[00:01:42] Speaker2:
And ultimately what this is doing is it's understanding that prompt, right? And understand what your intent is and also ultimately decides, Hey, which all products should I go and grab data

[00:01:52] Speaker1:
from? And the way that these different products across Cisco and even beyond, which we're gonna, you're gonna be able to see very shortly, is through registering their various tools, which can be APIs or agents directly in their respective MCP servers. So as you can see right here, there's a Meraki MCP, 1000 IS MCP, Splunk MCP and which they've all registered either their tools through APIs or agents directly into here. And that's connected to to our AI cams backend. Now, when it comes to ecosystem later on,

[00:02:20] Speaker2:
which is out of the scope of this particular session,

[00:02:23] Speaker1:
it'll be the same thing. We have third-party vendors also bringing MTP servers, registering their read and write operation tools directly in there as well.

[00:02:32] Speaker2:
So going back to it,

[00:02:33] Speaker1:
when the user types in their prompt, yeah, go ahead, Lila.

[00:02:36] Speaker2:
One good thing. So all of this is done by the intelligence of the system. So the orchestrator will choose the proper agent and that happens automatically with the backend, what MCP server to use. So based on the prompt, there's a lot of intelligence in the backend. Does it make sense to get information from Meraki? Or it makes sense to get information from Intrasight depending on what problem that is going to be decided automatically. Then when Richard goes into the demo, we might see actually Canvas deciding between one agent to the other and that information is shown. So that is pretty cool and the customers appreciate when they see those things that happen in the backend.

[00:03:20] Speaker1:
That's a great point. In fact, one point I didn't bring up earlier was that when we're actually reaching out to these MCP servers,

[00:03:27] Speaker2:
there's also an aspect of entitlement and

[00:03:29] Speaker1:
also RBAC that's being taken into consideration as well. So, yeah. So as a user, if I only have access to Maraki and thousand eyes,

[00:03:37] Speaker2:

the AI cam is back and we'll know this.

[00:03:39] Speaker1:
It won't allow me to be able to go and grab information from slunk, for example. So that all that's going to be taken into consideration. So you can rest, you can tell your customers to rest assure whatever they have today with regards to our back, when they tie the cloud control, it is all 100% respected. And that was, is a paradigm. It'll continue to always be it.

[00:03:58] Speaker1:
So one more thing to mention is that, Hey, how are we going from here to here, right? So, you know, when it, after it figures out what exactly you want to do

[00:04:06] Speaker2:
from your intent perspective, it then goes into our different specialized sub agents

[00:04:10] Speaker1:
that live in the back of AI canvas, because many of these right here would make it so that they're very much in tuned in refine to better understand, for example, wireless agent, better understand Meraki data when it comes to access points and RF, right? Or security agents better when it comes to understanding things like secure access

[00:04:25] Speaker2:
firewall data. So that ultimately when it goes through, it goes through these specialized

[00:04:30] Speaker1:
agents to go reach out to these Maraki, thousand eyes, Splunk, Cisco MCP, or third party MCP servers, it's able to grab the relevant information, execute the right tools, bring it back, do additional reason over the top, and then presented to the user as one single comprehensive and unified view that they can now consume and understand what had happened for next steps. Ultimately, MCP is really how we're now able to scale and get data across

[00:04:57] Speaker2:
all these different products across the board.

[00:05:02] Speaker1:
So hopefully this is something that will help you to be able to explain to your customers

[00:05:06] Speaker2:
how we're generally working in the back end

[00:05:08] Speaker1:
so that they have a better understanding when we're actually running any of these prompts later

[00:05:11] Speaker2:
or what I'm gonna show you on DCloud. And I like the fact that you're having some slides separate and going back and forth it makes a lot, it's very useful I should say when customers ask a question. So having the TDM deck, the VDM deck open and you obviously have to know what your slides are, could be very useful to answer those questions and in this case, explain the architecture. So that's a good way of combining slides with the actual demo.

[00:05:45] Speaker1:
Absolutely. I always say that although the key thing is going to be the demo, it is incredibly important to ground people in the factual things that the TDM really does a fantastic job at.

[00:05:57] Speaker2:
100%.

[00:05:58] Speaker1:
Yeah.
