```

[00:00:04] Speaker1:
All right, so now that we have an overview about, you know, Canvas, the problem statement, the backend architecture, let's go a little bit into the actual demo itself. So you know, we saw actions earlier. I want to go in, go step by step and talk about some of the key things that I think always resonate incredibly well at customer demos. So the first thing people want to see is like, well, what is Canvas? Like how does it work? Like, you know, kind of just give me some quick things I can understand right away. Perfect place is going to the prompt library. I just clicked on this forward slash right here and it brings up a prompt library. I'm going to go ahead and click on this very first one. How is the overall health of my Maraki catalyst center network slash sites. And you can see right away, very, very quickly, we're able to generate this interactive visualization directly in the workspace, as well as give you a direct natural language response. And the paradigm about Canvas again, is that we're generating these widgets whenever it supplements additionally to the response that we're getting from the assistant, we're not generating anything needlessly unless we believe that actually has that value.

[00:01:04] Speaker2:
So if you can click into here, right, I'm, I'm able to get a further

[00:01:08] Speaker1:
breakdown of what the, you know, if there are any issues, right? And it seems like right now we're not having any issues, but off the bat,

[00:01:15] Speaker2:
you can see that the visualization right here is much easier to read for

[00:01:18] Speaker1:
this type of a output than if it was just purely in text. So this is a, this is a situation where I would do so. Now a second thing that I would do is also click directly into some of these widgets right here. For example, I'm clicking on networks, right? Which it goes ahead and directly launches a prompt into here. I

says list all my, unless all my networks. And then I clicked on to connect the clients. This is also, she launches a prompt that says show me all my connected clients

[00:01:44] Speaker2:
across my networks.

[00:01:45] Speaker1:
So right off the bat, one thing we can emphasize is that campus is not just about printing, say a JPEG on a workspace.

[00:01:52] Speaker2:
It can be interactive.

[00:01:53] Speaker1:
It allows you to be able to click directly into it. And in fact, I, for example, I'm listing all my networks right here.

[00:01:59] Speaker2:
and it came back really fast, right?

[00:02:01] Speaker1:
I can click directly into one that perhaps, Hey, I'm the network admin for this is my particular preview.

[00:02:06] Speaker2:
And I can say, Hey,

[00:02:07] Speaker1:
I want to go ahead and add this one specifically to the board because I care about this one the most.

[00:02:11] Speaker2:
Or you know what, down here,

[00:02:13] Speaker1:
I'm showing all my connected clients across my networks.

[00:02:16] Speaker2:
I'm seeing all these right here

[00:02:17] Speaker1:
and what I care about this, I'm going to click add this entire thing to the board as well. And as you can see, along the way it generated my devices by type. So a very visual way to start off your demo is using prompt library and clicking some of those things that I had done just right there. Now, another thing I would also recommend for the purpose of Dcloud right now, and I'll preface that this is not currently in control availability yet, but this is something for the future, but you'll be able to also generate an entire topology view directly in Dcloud as well. And there's a couple of options that you can see directly here in the topology

prompt library. And what this is gonna do right now is grabbing information from Maraki and generates an entire SD-WAN topology. But the cool part that what you can really showcase the customer is that the canvas is going to be able to expand this into a full screen view,

[00:03:05] Speaker2:
allowing you to troubleshoot exactly and even click onto individual sites in

[00:03:09] Speaker1:
this case, or products in this case, or links in this case to showcase what exactly is that additional information. And we want to hone in probably on that red exclamation mark. We're all about finding issues here.

[00:03:20] Speaker2:
And we're going to click there. That that's the interesting part of the devil, of course.

[00:03:25] Speaker1:
Exactly.

[00:03:26] Speaker2:
I'm hoping everyone here is the first instinct.

[00:03:27] Speaker1:
Let's click on a red exclamation. Yeah. And, you know, obviously I was, what we want to do is like narrate, Hey, what's the problem? Right? It says unreachable right there. Pretty straightforward VPNs, unreachable. What do we do? Also only one option to do, right? Click investigate. So, you know, what we can emphasize on is that, Hey, generative UI is really just a very powerful thing.

[00:03:46] Speaker2:
And what does that investigate do? It just disappeared. So what you can say now is that, you know what? Remember what we just did

[00:03:52] Speaker1:
there for actions and brought the context of a problem that over-colded

[00:03:56] Speaker2:
alerts into Canvas, the troubleshoot, it's doing the exact same thing here for

[00:04:03] Speaker1:
that particular issue for the two, the links that are having some problems with reachability. So you can see right here, it's going ahead and routing that problem to the Meraki agent, because this is related to Meraki data.

[00:04:14] Speaker2:
And then we'll give it like a minute or two, it'll be able to come back

[00:04:16] Speaker1:
and give us some additional information about what's going on.

[00:04:20] Speaker2:
But that's how you can marry that box where it says Meraki agent to the slide that we showed before. of the routing is kind of the orchestrator agent and then we can see that the agents change depending on what prompt we are giving and that is the agent system that is where in the back end the system is deciding hey what's the best agents from the ones that I have or the most suitable agent to solve the problem at hand and that change is based on every single question that you have and that's something that you can share with your customers and you will see eventually, maybe with this query or not, we won't see, but if there's a widget... to be made, you might actually see the widget agent. So it's interesting to cover those while your query is in process, so you don't start there just waiting. There we go. So now we have the canvas agent. We see that the agent changed because we are giving a response. Absolutely. So yeah, if you're querying any questions about Nexus dashboard, you'll see Nexus dashboard agent, hyper fabric

[00:05:24] Speaker1:
agent, right? Later on when we're bringing in third party ecosystem, service now agent, right?

[00:05:31] Speaker1:
Exactly. You'll see all that's very visual and it's really just trying to give our customers a visualization into how we're doing routing in the back end, right? Which place is it actually going? So, you know, while we're waiting for this to actually fully load, a few things that can bring up is that there's a bunch of usability features here as well, right? You're going to be able to do things such as grouping by category, right? I can go ahead and sort the fit to the view of the board so I can better sort it. We only have a couple of widgets here,

[00:05:58] Speaker2:
but imagine you have 15, 20 of them

[00:06:00] Speaker1:
get absolutely out of control.

[00:06:01] Speaker2:
And there's an entire section here that I won't go into too much detail on

[00:06:05] Speaker1:
because we want to focus a little bit more on the troubleshooting aspects of the usability aspects of Canvas, such as even being able to see that there's color coded categories for each one of these widgets. So the you as a user can better organize your mind around exactly what it is that you should be going for which widgets, right? So so many different things, adding images, so on and so forth.

[00:06:25] Speaker2:
For me, what works is that I usually cover those usability elements while the prompt is going. If I run out of things to say, that's a good moment to cover these things. I feel.

[00:06:38] Speaker1:
Oh yeah, absolutely. The prompt loaded a little fast than I thought, which is a great problem to have. I was expecting a load for maybe a couple more seconds, but you know what? That's perfect, right? People are saying, you know what? I'm getting an output right away.

[00:06:48] Speaker2:
And I would tell you this, you know, when it comes to demoing

[00:06:52] Speaker1:
canvas, you want to show the first couple of times doing a live loading. Later on when you're doing deeper investigations, it's likely that you don't want to have to have the customer wait for the entire thing to help put

[00:07:01] Speaker2:
because it could take, you might not have enough time, right?

[00:07:04] Speaker1:
So do some level of prepping beforehand for certain flows that maybe take a little bit longer and just have a preloaded board. But when you start the demo, showcase it being loaded live time. If you see right here, right? The cool part is that we can say, Hey, like we just loaded this investigation within in a minute, minute and a half, we were able to get this outcome right here. And it tells you exactly what the problem is. It tells you in Buena Ares that, Hey, look, do you look at all these different scores in particular VP and hell score is at 33%. Right. So it calls out exactly what problem that we're seeing directly in

[00:07:35] Speaker2:
that widget right there beyond that, right? It tells you what other symptoms are there, right? It tells you, Hey, you know what? It's, you know,

[00:07:40] Speaker1:
there's, you know, the vice health is a hundred percent, right? There's no configuration changes. So let's go to the next part and then talks about the reachability, right? It tells you about, Hey, look, you You know, between Toronto and Buenos Aires and it's unreasonable, right? So basically telling you the entire blast radius now, right? So we're going one level lower and then, right? Going all the way down to the bottom here, it tells you, Hey, these, this is going to be your primary blast radius that you should be worrying about.

[00:08:03] Speaker2:
And it tells you the recommendations of exactly what you should do,

[00:08:06] Speaker1:
but not just that it tells you in priority order so that you can, you know, figure out exactly what you'd be doing first versus second versus third. That's really the power of canvas here being able to just summarize that and being able to kind of just divide and help people, help you to divide it into chunks of what I do actionably next.

[00:08:27] Speaker2:
So in order to summarize, you started with the backslash with the pre-created queries. You asked for a general query. You showed, as you say, live a query live so we can see how we are invoking the agents, how the charts are being loaded. You then show the SD-WAN topology We found exclamation mark in red. You click on that, investigate it. While doing this investigation, we went through the auto layout and the start cards and eventually we went back to explain what happened with the VPN problem that we identify. So this is a really good flow to replicating customer demos.

[00:09:12] Speaker1:
Exactly, and you can always mention that, hey, you wanna get more information before you follow these recommended next steps. It's a natural language experience, right? You just ask additional questions here, anything you want.

[00:09:21] Speaker2:
Yeah.

[00:09:21] Speaker1:
Deep dive further. Exactly. All right. So I think we give a high level, right? So customers at this point are saying, OK, cool. I'm able to see some nice visuals. I can see an outcome already.

[00:09:32] Speaker2:
You know what? But I want to do some very deep investigation.

[00:09:36] Speaker1:
So what I would do at this point in time is I would showcase, hey, you have a high level now. Let's talk about how we can go into a deeper investigation flow. And I would do exactly this by going into something called the reasoning mode.
