```

[00:00:03] Speaker1:
For those who are not aware about what reasoning mode is the difference between first of all Reasoning mode and default mode as you saw we're running earlier because our reasoning will go Significantly more in-depth and one of the analogies that I like to use is that if I ask about why Wi-Fi is having issues in default mode Might just give me a Wi-Fi health RF health summary and call it a day, right? Because it's getting the directional guidance of what it do and do some it doesn't basic reasoning But if you go into reasoning mode the difference is that they'll talk about not just the health level But, oh, is there something wrong with my RF, channel utilization, any sort of co-channel interference, AP hardware, right? Is it my client issue, right? Is it my client's issue? Is it having issues with authentication? Is it ICE? It goes through a very, very deep radical.

[00:00:47] Speaker2:
Sounds like it might take a little bit longer, right? It might take a little bit longer if it's going to do all those things. Is that the expectation?

[00:00:55] Speaker1:
It'll take a little bit longer. But analogy I also like to use is that this is the same thing when it it comes to things, something like use, just using Claude or GBT versus regular mode versus say research mode, which in research mode, you ask a question about something, you'll go online, get information across like a 300 websites, comes back in five, 10 minutes and gives you a very comprehensive reply versus a more, you know, a less deep reply.

[00:01:19] Speaker2:
So that's a good thing to exactly. So that's a good thing to highlight when talking to your customer and how, how did you prep? it seemed like you, you already had a different window open that was clean to start the deep reasoning. Do you have any tips on how you transition from the other investigation to here, or you open just a new canvas?

[00:01:44] Speaker1:
You know, my, my suggestion for folks here is have a couple of windows, just fully open just in case, cause sometimes you're waiting for this to load, you don't want to close it, right? You want to just have it open and then just quickly be able to pivot to another screen. And then you can either just say, you're waiting for that one to load again. You just come back, right? And you're like, oh yeah, look, it loaded. Here's the output. And, you know, it's the safest to make sure that the browser does not time out as well. They just keep it as a full screen window open.

[00:02:08] Speaker2:
So this is something,

[00:02:09] Speaker1:
there's a little bit of slight of hand when it comes to, I would not even say just Canvas demo, which is any demo that you absolutely need to practice to make sure it's just smooth.

[00:02:17] Speaker2:
So again, for everyone on the call, this is a great tip, having multiple decal demos opened, clean so that you can, you can go back and forth with PowerPoint, with the multiple windows, all in full screen mode. Uh, those are great tips. I love absolutely.

[00:02:35] Speaker1:
Yeah, exactly. And, you know, well, let's go into the actual content here. So earlier I was asking about, Hey, why is our trading app slow for Mexico office? Maybe that's my HQ and is this a network security or server issue? So as you can see right here, what happens with deep reasoning mode is it creates for you an entire comprehensive plan based on press practices. Like I always like to say troubleshooting IT is not quote unquote rocket sites. There's a finite ways to, for what things you should look at. And our LLM is trained to be able to know exactly that. It talks about what the objective is based on what you have typed in from your prompt talks about the approach. And you can emphasize running parallel investigations. And then it talks about exactly what's going to do in every phase of that investigation, such as, Hey, I'm going to go ahead and look at network path and when health, right? I'm going to go look at things like SD when, right? Ultimately for this particular section. And then I'm going to look at things from the security stacks, such as secure access and secure firewall for ZTNA VPN and talks about those specific bullets. Then it talks about how it's going to look at server and compute health. When it comes to things like intersite to understand whether or not trading at servers, how you're having any issues, and then ultimately thousand eyes for observability, so on and so forth, right? And then correlate that all together. So at this point in time, I can either hit or approve or revise the plan. I might want to revise if I know that, hey, for example, the issue is definitely not with firewall. Don't even bother to spend any time looking at that. Or I have maybe additional thing that I think that, you know, we should investigate that perhaps the LLM thinks that, hey, this is not likely where the issue is at, but I want to add it. So I can. Ultimately, it'll wait for you to approve that plan because that we're spending the next, say, five, six minutes troubleshooting and investigating the areas that you wanted to do versus not. And then you can see right now, the moment

we hit approve, it starts to undo that investigation and goes through step by step or nine to step by step, these things in parallel. And then ultimately it will give you a synthesized root cause analysis.

[00:04:29] Speaker2:
And we can see at the bottom how the agents change. And we just saw the S1 agents. Now we have the, the intracide agent. So the system in itself is telling you at the top and at the bottom everything that's going on.

[00:04:44] Speaker1:
Exactly. So you know what, while we're waiting for this one to load, I'm going to go ahead and go into a different board where I have one of these things preloaded for you to just see the output, and this is what I exactly ought to do with a customer too. I'll tell them, hey, you know what, for the interest of your time, let's go ahead and showcase the same experience that I've already run beforehand. So you can see the output and we can come back later to prove to you that it's actually finished as well. So you can see right here the exact same prompt. And the way the reasoning mode works that you should explain is that again, we're ultimately trying to get to this final summary here that talks about what exactly the issue in primary causes and recommended next steps. But along the way, evidence gathering is just as important. It looks through and tells you where the issues are. For example, I'm seeing right here, there's an access switch that's cycling between unreasonable every two hours, right? I'm I'm seeing right here that there's actually no VPN site to site VPN tunnels right here, which could be a problem, right? Between two of my, for example, my HQ and my branch, for example. And, you know, so it goes down and talks about every single one of these evidence that is able to get. And then talks about then a final root cause summary, which then it prioritizes where it believes the issues are. Now it actually just says it right off the back here in the issue section, missing VPN tunnel cycling access layer switch. Also it seemed like there's a six minute drift, which can cause some random issues in your network as well. So it does all this and then tells you the recommended actions for how do you should go about resolving every single one of these things. Because like I mentioned before, it's all about providing you with evidence and confidence specifically for customers that we're telling you the right things and not making anything up, not hallucinating anything. And one last point I want to mention is that it's also about not just meantime, the resolution MTTR. It's also about MTTI. It's about proving innocence for the different products that don't have a problem. So you don't spend problem in cycles, they're troubleshooting. Reasoning mode will do exactly that while also generating a bunch of supplemental visualizations that will just help you to better understand it overall. So I think this is a really

[00:06:45] Speaker2:
compelling feature. What do you think, Leela? Oh, I think it is. And I want to summarize the way you are going with this. So you had a query prompt that you studied in another window that shows how to you approve the plan and you kicked off the plan and then you have a separate window in which you had already run beforehand that same query you are familiar with the actual output you were calling out areas obviously we are not going to read all these to the customer but you were calling out the areas that are more interesting where we want to bring the attention and then explaining the value of deep reasoning mode, how it's different from the

regular mode. And I love the call out between MTTR and MTTI. So I think the actual top track has also to be on point to match the actual demo. But all these using multiple windows with pre-created queries again part of the prep that we discussed before and this is key.

[00:07:51] Speaker1:
Absolutely it's all about being smooth right and you know being able to showcase as much as you can during that period of time while giving the customers value and really understanding especially relating to where their pain points are and where they want to get to. This right here is really the crux of getting the customer where customers really care about

[00:08:09] Speaker2:
deep reasoning mode. Yes, but also we don't want to get stuck with a window that needs fights because again, deep reasoning will take longer and it's expected. And so we don't want to get stuck in having to wait seven minutes for an outcome and then we need to tap dance there. So having the same query pre-created before is a good tip for demoing.

[00:08:31] Speaker1:
Absolutely. And you can see right now the reasoning mode, the other one is still loading which is expected. It's expected, but like we said, let's get to the content right away. way so the customers can just see that value just off the bat.

[00:08:44] Speaker1:
Now let's go ahead and pivot is something else at this point, right? You know, we, we talk, you know, I think I've gone ahead and talked about a number of different things that will allow you as a user to be able to get value out of the system, right? When it comes to reasoning, there's one more item that I do want to mention that I think believe is very useful and relevant to customers. What is going to be knowledge base?
