```

[00:00:04] Speaker1:
Now, when it comes to operations for any customers, we all know that they have a ton of their own context. They, they troubleshoot in different ways. They have certain sites that perhaps they cannot touch because they're mission critical, so on and so forth. Right. So one point I do want to bring, and this has always been incredibly compelling for every customer you talked about is the fact that we have an ability right here to click on that plus sign or that, you know, that, that pond center right there and be able to select and upload your own knowledge base. So in this case, right here, I've gone ahead and click on, I've gone ahead and uploaded a knowledge base, right? Called knock, right? And there's one right here called KB file for D cloud. I created that here for the purpose of demo. And what happens is that I can go ahead and click on that here, right? I can, I can click and upload that and run a prompt with it. So you can see right here, I should let me close this real quick. This is how is my overall health of my Moroccan organization. As you can imagine, if we asked this normally, it would just give me a very high level health, right? not much more because that's all you're asking for, but then I'm going to say, you want to follow this knowledge file closely and the knowledge file right here is this file right here, which can be any markdown file, any text file, PDF, word doc file. Really the LLM just takes it in as a bunch of text.

[00:01:14] Speaker2:
Good question. So is this, anyone can use it in deep load or you have to do something specific or it's available for any deep load user to use this particular example that you're showing in the generic miraki run book.

[00:01:29] Speaker1:
This particular example is available for anybody here. So anybody can use it right off the bat. Now this is purely an example. So anybody here watching this video actually has a, has a particular run book. They feel like, Hey, I want to go ahead and add this to the D-Cloud because this will be very compelling. Feel free to reach out to us where we're happy to go ahead and evaluate and get out of the D-Cloud as well. So, you know, the run book here was meant to be generic, just to

display a point, right? which is that, Hey, I'm going to make it so that when canvas starts running that prompt I mentioned earlier, it has all this in context. It has context at Mexico city is my flagship site.

[00:02:05] Speaker2:
And you know what?

[00:02:06] Speaker1:
This is the site lead with Carlos, right? And this is their web X handle. This is their web X space. And beyond that, there's a number of other things that I mentioned right here, which is that, Hey, when it comes to escalations, you want to do tier one cities first before tier two and tier three. And then, you know what? These are the ways I want you to do troubleshooting. I, this is the way I want you to structure the output. because maybe as a customer, my exec always wants to be able to see outputs in a very specific way, right? Title at a glance. It's happening. Right. So I also want you to color code it. The point is that there's so many things that you can do. This is just one of very many examples that of what you can do, but if you look closely here from the output, it completely changes that. It's showing you that the Maraki health of the overall health on my Maraki org is first of all tiered in this specific way. First of all, tears it off. Mexico city, my tier one, and it gives you all that information across every single site and even references the owners that you had before. So

[00:03:00] Speaker2:
why would we need this, first of all?

[00:03:02] Speaker1:
It's like, if I'm that top level admin that's just looking across my entire, you know, network infrastructure or security infrastructure, it's very possible my L1s don't know who to escalate to. It's very possible my L2s are, you know, they don't have the holistic view that I do. So this gives the knowledge and context to every single one of them in their particular organization. As you can see, like it goes down. Yeah, go ahead, Lila.

[00:03:22] Speaker2:
No, I was going to say, and also this is something that a lot of our customers have. So this is a good opportunity to have that conversation with the customer if time permits on what their operational model looks like, whether or not they already have run bugs. And if they do, you can see that they jump into this option really fast because this really will steer the troubleshooting process and the output to the way they already do it today. So that's gonna be very interesting for them.

[00:03:53] Speaker1:
Absolutely. I will mention in Preface briefly is that there's gonna be a way to do this directly the agent builder on cloud control studio as well. So we'll pivot that to that later right now. This, this is still available in AI canvas, which will allow you to really get the point across. Uh, but just a point to notice that we're going to be building an additional functionality there as well for bringing in context. Now, a few other points I want to make sure that we're bringing out when we're typing in something like this is that, Hey, we merlier in the, in the new

context knowledge, uh, knock run book. We're saying that we care about Mexico city the most.

[00:04:25] Speaker2:
So you can see, right?

[00:04:26] Speaker1:
It really is focusing now on Mexico city. I did not mention this anywhere in my original prompt, but because I had that in my context saying that that's my headquarters, I'm looking at first of all recent configuration chains, Mexico city, right? You just focus on that first before going into any of the other ones as much. And then it also goes ahead and talks about a, you know, it gives you the different titles and sections based on exactly how you want it. Hey, what should I take it? What rules are applied? Right? What was the bottom line? Right? What exactly should I do? So on and so for it. So this is what knowledge base will help you to do. I really just give the entire steer the campus the reason in a way that you as a user would care about doing it so.

[00:05:05] Speaker2:
So I think this has been a great demo. I want to call out that probably you will not have time for all the elements that we talked about today. And the whole idea here is that you pick and choose the areas that are going to be resonating more with your customer. And that's completely Okay. So this is great. Obviously you might not need to use all this information for a demo. It depends on the time you can pick and choose your use cases and we want to give you a few bonus use cases in case you come from other architectures that we haven't covered so much today. So Richard is going to go through an NDFC Nexus dashboard and SD1 and a firewall specific workflow. So these are the bonus use cases for today.
